## Best Practices for registers and registries & Technical Guidelines for the INSPIRE register federation

---

<b>Title</b>	Best Practices for registers and registries & Technical Guidelines for the INSPIRE register federation
<b>Creator</b>	JRC registry team
<b>Date of publication</b>	2017-05-31
<b>Subject</b>	Best Practices for registers and registries & Technical Guidelines for the INSPIRE register federation
<b>Status</b>	Version 1.0  This document has been endorsed by the INSPIRE maintenance and implementation group (MIG) through written procedure on 28/02/2017.
<b>Publisher</b>	INSPIRE Maintenance and Implementation Group (MIG)
<b>Type</b>	Text
<b>Description</b>	This document describes best practices for setting up registers for INSPIRE, including for extended INSPIRE code lists. It also includes technical guidance for sharing national or community registers in the INSPIRE register federation and for using the federation's access point (the "register of registers") to search and browse through the registers included in the federation.
<b>Format</b>	PDF

## Foreword

**Directive 2007/2/EC** of the European Parliament and of the Council [**INS DIR**], adopted on 14 March 2007 aims at establishing an **Infrastructure for Spatial Information in the European Community** (INSPIRE) for environmental policies, or policies and activities that have an impact on the environment. INSPIRE will make available relevant, harmonised and quality geographic information to support the formulation, implementation, monitoring and evaluation of policies and activities, which have a direct or indirect impact on the environment.

INSPIRE is based on the infrastructures for spatial information established and operated by the 28 Member States of the European Union. The Directive addresses **34 spatial data themes** needed for environmental applications. This makes INSPIRE a unique example of a legislative “regional” approach.

To ensure that the spatial data infrastructures of the Member States are compatible and usable in a Community and trans-boundary context, the Directive requires that common **Implementing Rules** (IR) be adopted in the following areas.

- Metadata;
- The interoperability and harmonisation of spatial data and services for selected themes (as described in Annexes I, II, III of the Directive);
- Network Services;
- Measures on sharing spatial data and services;
- Co-ordination and monitoring measures.

The Implementing Rules are adopted as Commission Decisions or Regulations, and are legally binding.

In addition to the Implementing Rules, non-binding **Technical Guidance** documents describe detailed implementation aspects and relations with existing standards, technologies and practices in order to support the technical implementation process. They may need to be revised during the course of implementing the infrastructure to take into account the evolution of technology, new requirements, and cost benefit considerations. In other words, these Technical Guidance documents are **supporting material to assist in the technical implementation** of the INSPIRE Directive but no additional obligations can be derived from these documents over and above the obligations set out in the Directive and the Implementing Rules. The Technical Guidance documents are also not intended to interpret legal obligations.

This document describes **best practices for setting up registers for INSPIRE**, including for extended INSPIRE code lists. It also includes **technical guidance for sharing national or community registers in the INSPIRE register federation** and for using the federation’s access point (the “register of registers”) to search and browse through the registers included in the federation.

Implementing this Technical Guidance are designed to maximise the interoperability of INSPIRE services. Technical Guidance documents describe **how Member States might implement the Implementing Rules** described in a Commission Regulation. The technical provisions and the underlying concepts are often illustrated by use case diagrams and accompanied by examples. Technical Guidance documents may also include non-binding technical recommendations that should be satisfied if a Member State chooses to conform to the Technical Guidance. However, these recommendations have no legally binding effect.

**Disclaimer**

This document has been developed collaboratively through the INSPIRE maintenance and implementation framework, involving experts of the European Commission services, the European Environment Agency, EU Member States, the Accession and EFTA Countries. The document should be regarded as presenting an informal consensus position on best practice agreed by all partners. However, the document does not necessarily represent the official, formal position of any of the partners. To the extent that the European Commission's services provided input to this technical document, such input does not necessarily reflect the views of the European Commission and its services. This document does not bind the Commission and its services, nor can the Commission and its services be held responsible for any use which may be made of the information contained herein.

The technical document is intended to facilitate the implementation of Directive 2007/2/EC and is not legally binding. Any authoritative reading of the law should only be derived from Directive 2007/2/EC itself and other applicable legal texts or principles such as the related Implementing Rules. Only the Court of Justice of the European Union is competent to authoritatively interpret Union legislation.

## Executive Summary

*Registers* provide a means to assign unique identifiers (or “reference codes”) to and consistently manage different versions of resources used in the INSPIRE infrastructure, such as INSPIRE code lists, INSPIRE themes, coordinate reference systems or application schemas. *Registries* are information systems for the maintenance and publication of registers.

INSPIRE includes only one legal obligation related to registers: extensions by data providers of the code lists mandated in Commission Regulation (EU) No 1089/2010 on interoperability of spatial data sets and services need to be published in registers. This document provides technical guidance for setting up such registers for extended INSPIRE code lists.

However, Member States and thematic communities are setting up registers for other purposes as well, e.g. to have a single repository of all organisations in a MS responsible for implementing INSPIRE, including their unique identifiers. In general, registers are useful in all situations where, by a reference code rather than free text, in data exchange, ambiguities or inconsistencies can be avoided. Also registers can facilitate the internationalisation of user interfaces by providing multilingual labels.

Therefore, this document also includes general guidance and best practices for setting up registers supporting INSPIRE implementation and for sharing the content of national or community registers in a *register federation* and for using the federation’s access point (the “register of registers”) to search and browse through the registers included in the federation.

This document is based on the work of the sub-group MIWP-6 on registers and registries of the maintenance and implementation group in 2015 and 2016.

# 1 Introduction

*Registers* provide a means to assign unique identifiers (or “reference codes”) to and consistently manage different versions of resources used in the INSPIRE infrastructure, such as INSPIRE code lists, INSPIRE themes, coordinate reference systems or application schemas. *Registries* are information systems for the maintenance and publication of registers.

Managing and making available items in registers offers several benefits [adapted from ISO 19135-1]:

- a) Registration of items supports wider use of registered items by making them publicly available to INSPIRE users.
- b) Registers may provide a single mechanism to access information concerning items that are specified or used in different INSPIRE components.
- c) Registers provide a mechanism for managing temporal change (of available items of a certain type and their definitions).

NOTE Items specified in a register may change over time either due to changes in technology or for other reasons. INSPIRE documents may not clearly document what changes may have occurred, and do not include information about earlier versions of specified items. Such information can be maintained in a register.

- d) Registers may be used to make sets of standardized tags available for encoding of registered items in data sets.
- e) Registers can support cultural and linguistic adaptability by providing both a means for recording equivalent names of items used in different languages, cultures, application areas and professions, and a means for making those equivalent names publicly available.

INSPIRE includes only one legal obligation related to registers: extensions by data providers of the code lists mandated in Commission Regulation (EU) No 1089/2010 on interoperability of spatial data sets and services need to be published in registers [INS ISDSS, Art.6(2)]. INSPIRE implementers need technical guidance on how to set up such registers for extended INSPIRE code lists and how these can be linked to the central INSPIRE code list register.

At the same time, Member States and thematic communities are setting up registers for other purposes as well, e.g. to have a single repository of all organisations in a MS responsible for implementing INSPIRE, including their unique identifiers. In general, registers are useful in all situations where, by a reference code rather than free text, in data exchange, ambiguities or inconsistencies can be avoided. Also registers can facilitate the internationalisation of user interfaces by providing multilingual labels.

Within the MIWP 2014-2016, an action and sub-group<sup>2</sup> (MIWP-6) was therefore set up to develop technical guidelines and best practices for setting up register and registries and for publishing and accessing European, national or community registers and the links between them through a *register federation*. The action also worked on setting up an access point to the INSPIRE register federation, the *register of registers* (RoR).

Based on the work of the MIWP-6 sub-group, this document contains

- best practices for setting up registers supporting INSPIRE implementation (section 4.2);
- best practices for setting up registers for extended INSPIRE code lists and how to link them to the central INSPIRE code list register (section 4.3);

---

<sup>2</sup> See <https://ies-svn.jrc.ec.europa.eu/projects/inspire-registry>

- a description of the concept and architecture of the INSPIRE register federation and the register of registers (section 5);
- guidance for sharing the content of national or community registers in the INSPIRE register federation (section 5);
- guidance for using the register of registers to search and browse through the registers included in the federation (section 7).

It also includes several annexes with detailed examples (Annex A), validation scripts (Annex B), frequently asked questions (7.3Annex C) and an overview of existing software for registry management (Annex D).

Items for future work on this document include:

- Documentation of the API of the RoR
- Support for multi-lingual registers in the RoR harvesting

## 2 Normative references

## 3 Terms and abbreviations

### 3.1 Terms

- (1) **code list**: open enumeration that can be extended [INS-ISDSS]
- (2) **dereferenceable**: dereferencing a URI will return a representation of the resource in a well-known representation.
- (3) **enumeration**: data type whose instances form a fixed list of named literal values. Attributes of an enumerated type may only take values from this list [INS-ISDSS]
- (4) **externally defined item**: item that is originally defined outside the register containing it, i.e. it is an item that is reused from another register.
- (5) **internally defined item**: item that is originally defined inside the register containing it.
- (6) **item**: anything that can be described and considered separately [ISO 19157]  

NOTE An item can be any part of a dataset, such as a feature, feature relationship, feature attribute, or combination of these.
- (7) **item class**: set of items with common properties [ISO 19135-1]  

NOTE Class is used in this context to refer to a set of instances, not the concept abstracted from that set of instances.
- (8) **metadata**: information describing spatial data sets and spatial data services and making it possible to discover, inventory and use them [INS DIR]  

NOTE A more general definition provided by [ISO 19115] is "data about data"
- (9) **multilingual**: in or using several languages [Oxford Dictionary]
- (10) **register**: set of files containing identifiers assigned to items with descriptions of the associated items [ISO 19135-1]
- (11) **registry**: information system on which a register is maintained [ISO 19135-1]
- (12) **registry service**: Service that provides access to a register
- (13) **resource**: asset or means that fulfils a requirement [ISO 19115]

NOTE A resource can be anything that has identity. In the context of the web as the network of INSPIRE, a resource will be identified by a URI. For resources managed in INSPIRE registers, the URIs will be persistent and dereferenceable.

EXAMPLE: Dataset, service, document, person or organization. ...

## 3.2 Symbols and abbreviations

API	Application Programming Interface
ATOM	Atom Syndication Format
CSV	Comma Separated Value
ISDSS	Interoperability of spatial data sets and services
ISO	International Organization for Standardization <sup>3</sup>
JSON	JavaScript Object Notation
MD	Metadata
MIWP-6	MIG sub group on registers and registries
MS	Member state
RDF	Resource Description Framework
RoR	Register of Registers
SKOS	Simple Knowledge Organization System
TG	Technical Guidance
URL	Uniform Resource Locator
XML	eXtensible Markup Language
XSD	XML Schema Definition

## 3.3 Verbal forms for the expression of provisions

This section describes the notation and verbal forms used for the

- *best practices* for setting up registers supporting INSPIRE implementation and for setting up registers for extended INSPIRE code lists and how to link them to the central INSPIRE code list register (section 4) and
- *technical guidance* for sharing the content of national or community registers in the INSPIRE register federation (section 5).

### 3.3.1 Best Practices

The description of best practices is inspired by the template used in the Data on the Web Best Practices document [W3C DWBP] published by W3C. The structure used in this document is presented below.

---

<sup>3</sup> <http://www.iso.org/iso/home.htm>

Short description of the best practice.

### Why

This section answers two crucial questions:

- Why this is specifically relevant to setting up registers?
- How does this encourage publication or reuse of registers?

### Intended Outcome

What it should be possible to do when a register provider follows the best practice.

### Possible Approach to Implementation

A description of a possible implementation strategy is provided. This represents the best advice available at the time of writing but specific circumstances and future developments may mean that alternative implementation methods are more appropriate to achieve the intended outcome.

### Example

An example of a register or registry implementing the best practice.

### See also

Where relevant, references to the relevant best practices in the Data on the Web Best Practices document [W3C DWBP].

## 3.3.2 Technical Guidance

In accordance with the ISO rules for drafting, the following verbal forms shall be interpreted in the given way:

- “shall” / “shall not” : a requirement, mandatory to comply with the technical guidance
- “should” / “should not” : a recommendation, but an alternative approach may be chosen for a specific case if there are reasons to do so
- “may” / “need not” : a permission

### Conformance Classes notation

The Technical Guidance in this document is divided into Conformance Classes, so that it is possible to declare conformance to specific parts of the Technical Guidance. *To conform to a Conformance Class it is necessary to meet all of the Requirements (see next section) in that Conformance Class.*

Conformance Classes are identified in the document as follows:

**TG Conformance Class #: [TITLE]** conformance classes are shown using this style

### Technical Guidance Requirements and Recommendations notation

Requirements and the recommendations within this technical guidance are highlighted and numbered as shown below:

**TG Requirement #** requirements are shown using this style

**TG Recommendation #** recommendations are shown using this style.

Requirements and recommendations belong to the conformance class in which they are found in this document.

NOTE It is worth noting that requirements as specified in the INSPIRE Implementing Rules are legally binding, and that requirements and recommendations as specified in INSPIRE Technical Guidance are **not** legally binding. Therefore, within this technical guidance we have used the terms 'TG requirement' and 'TG recommendation' to indicate what is technically required or recommended to conform to the Technical Guidance.

### XML Example notation

XML Examples are shown using Courier New on a grey background with bold text for emphasis as shown below:

```
<inspire:example>
  <inspire:highlight>
    Highlighted Text for emphasis
  </inspire:highlight>
</inspire:example>
```

NOTE XML Examples are informative and are provided for information only and are expressly not normative.

## 3.4 References

References within this document are denoted using "Section" or "Annex". For example, Section 5.3.1 or Annex A.

References to other documents refer to the list of normative references in Section 2 and use the abbreviated title as indicated in **Bold** text. For example, **[INS DIR]** uses the abbreviated title for the document as shown below:

**Directive 2007/2/EC of the European Parliament and of the Council of 14 March 2007 establishing an Infrastructure for Spatial Information in the European Community (INSPIRE), OJ L 108, 24.4.2007, p. 1**

References within other documents are shown as above using the reference code, together with the appropriate section within the document. For example, **[INS DIR, Art 1 (1)]**, refers to Article 1.1 within the document as listed above.

## 4 Registers and registries

Registries and registers are used to maintain information elements at different administrative levels (e.g. European, national level) and in different thematic domains or contexts.

A registry is an information system on which registers are maintained [ISO 19135-1]. In an infrastructure, a registry serves as a central access point where labels, descriptions and other metadata for reference codes can be easily maintained, checked by humans or retrieved by machines.

A register is a set of files containing identifiers assigned to items with descriptions of the associated items [ISO 19135-1]. Registration is the assignment of an unambiguous name to an object in a way that makes the assignment available to interested parties.

Registers can be hierarchical. Hierarchical registers consist of items that are themselves registers, i.e. they are structured sets of registers composed of a principal register and several sub-registers.

EXAMPLE The INSPIRE code list register is a hierarchical register, which contains code lists as its items, which in turn contain code list values as their items.

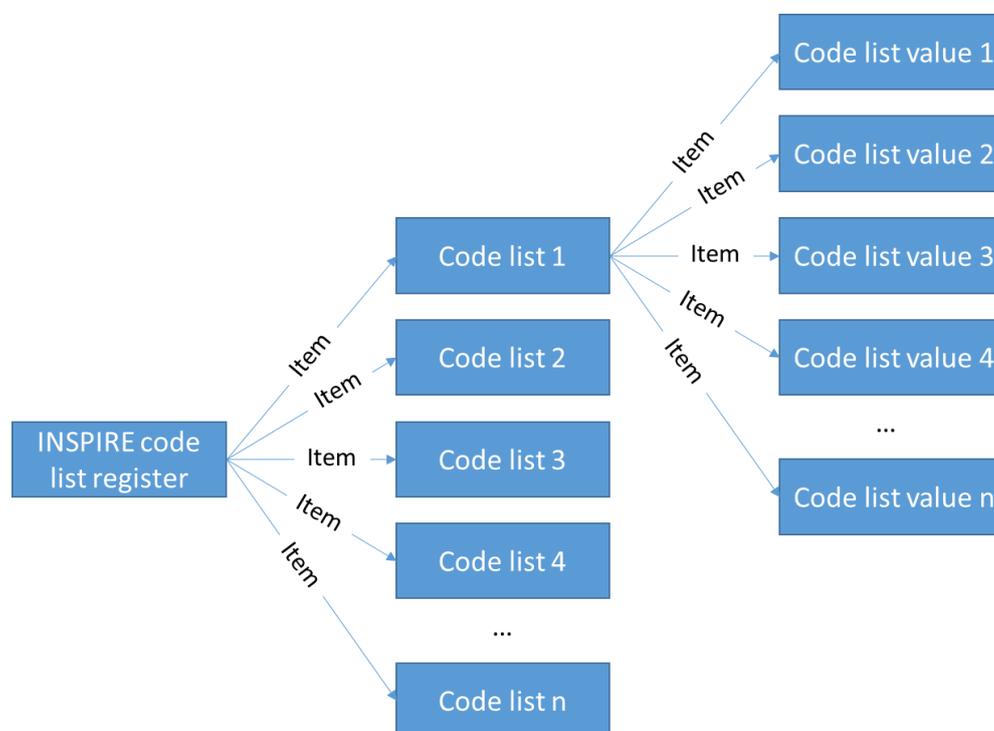

Figure 1 - Example for a hierarchical register

## 4.1 INSPIRE requirements for code lists and code list extensions

[INS ISDSS] includes the following requirements related to code lists, enumerations and their possible extensions by data providers.

### Article 6

#### Code Lists and Enumerations for Spatial Data Sets

1. Code lists shall be of one of the following types, as specified in the Annexes I to IV:
  - (a) code lists whose allowed values comprise only the values specified in this Regulation;
  - (b) code lists whose allowed values comprise the values specified in this Regulation and narrower values defined by data providers;
  - (c) code lists whose allowed values comprise the values specified in this Regulation and additional values at any level defined by data providers;
  - (d) code lists, whose allowed values comprise any values defined by data providers.

For the purposes of points (b), (c) and (d), in addition to the allowed values, data providers may use the values specified in the relevant INSPIRE Technical Guidance document available on the INSPIRE web site of the Joint Research Centre.
2. Code lists may be hierarchical. Values of hierarchical code lists may have a more general parent value. Where the valid values of a hierarchical code list are specified in a table in this Regulation, the parent values are listed in the last column.
3. Where, for an attribute whose type is a code list as referred to in points (b), (c) or (d) of paragraph 1, a data provider provides a value that is not specified in this Regulation, that value and its definition shall be made available in a register.
4. Attributes or association roles of spatial object types or data types whose type is a code list may only take values that are allowed according to the specification of the code list.
5. Attributes or association roles of spatial object types or data types that have an enumeration type may only take values from the lists specified for the enumeration type.

In the central INSPIRE registry, the four types of code lists defined in Art. 6(1) are described through the *extensibility* property of the code list (see Table 1).

Table 1 – Extensibility of code lists

IR Reference	Extensibility (code)	Definition
Art. 6(1)(a)	Not extensible ( <i>none</i> )	The code list cannot be extended, i.e. its allowed values comprise only the values specified in the central INSPIRE code list register.
Art. 6(1)(b)	Extensible with narrower values ( <i>narrower</i> )	The code list can only be extended with narrower values, i.e. its allowed values comprise the values specified in the central INSPIRE code list register and narrower values defined by data providers.
Art. 6(1)(c)	Extensible with values at any level ( <i>open</i> )	The code list can be extended with additional values at any level, i.e. its allowed values comprise the values specified in the central INSPIRE code list register and additional values at any level defined by data providers.
Art. 6(1)(d)	Empty code list ( <i>any</i> )	No values are specified for this code list in the central INSPIRE code list register, i.e. its allowed values comprise any values defined by data providers.

Art. 6(3) is the only requirement on INSPIRE data providers to publish data in a register. No further requirements are included in [INS ISDSS]. The following section contains a number of best practices for setting up registers – for code lists or other item classes.

## 4.2 Best practices for setting up registers and registries

Based on the definition of a register from [ISO 19135-1], a basic register could already be created through a simple document (e.g. a text document or spreadsheet) that contains a list of items, each of which is mapped to an identifier.

In this section, we add a number of best practices for the setting up and operation of registers that make them more useful in the context of a distributed spatial data infrastructure such as INSPIRE. Most of these recommendations are valid for any data being published on the web. Where relevant, we therefore include references to the relevant best practices in the Data on the Web Best Practices document [W3C DWBP] published by W3C.

Typically, software packages or online services will be used for managing registers according to these guidelines / best practices. Some examples are listed in Annex D.

**NOTE** To our knowledge, there is currently no centralised service at European level that can be used for managing MS registers.

The following list presents some best practices to follow in order to create/maintain registers/registries:

- 4.2.1 Best Practice 1: Use well defined roles, responsibilities and procedures for register management
- 4.2.2 Best Practice 2: Use resolvable URIs (HTTP-URIs) as identifiers for registers and register items
- 4.2.3 Best Practice 3: Use item classes
- 4.2.4 Best Practice 4: Use well-defined statuses
- 4.2.5 Best Practice 5: Do not delete items
- 4.2.6 Best Practice 6: Provide registers in different formats
- 4.2.7 Best Practice 7: Use content negotiation for serving registers available in multiple formats
- 4.2.8 Best Practice 8: Provide registers in different languages

### 4.2.1 Best Practice 1: Use well-defined roles, responsibilities and procedures for register management

Clearly document roles, responsibilities and procedures for the management of a register and the registry through which it is made available.

#### **Why**

Having a set of roles and associated responsibilities helps to better understand the different parties involved in the registration and maintenance processes of a registry.

#### **Intended Outcome**

Register users will be able to understand who is responsible for managing a register and the registry through which it is made available and the processes for proposing and deciding about changes to register content.

#### **Possible Approach to Implementation**

The following roles and responsibilities are defined in [ISO 19135-1]. For more detailed information

refer to [ISO 19135-1] Chapter 5.

- **Register owner:** a register owner is an organization that has established one or more registers, and has primary responsibility for the management, dissemination and intellectual content of those registers.
- **Register manager:** a register owner may delegate the role of register manager to another organization. A register manager may manage multiple registers.
- **Submitting organizations:** a submitting organization is an organization that is qualified under criteria determined by the register owner to propose changes to the content of a register.
- **Control body:** a control body is a group of technical experts appointed by a register owner to decide on the acceptability of proposals for changes to the content of a register. A control body may not be required for simple registers.
- **Registry manager:** a registry manager is a person or an organization responsible for the day-to-day management of a registry. A register manager may engage a third-party service provider to perform this service.
- **Register user:** Register users access a registry in order to use one or more of the registers held in that registry. Register users include any person or organization interested in accessing or influencing the content of a register.

A possible list of procedures to manage the registration and maintenance process can be found in chapter 6 of [ISO 19135-1].

#### Example

The following roles have been defined for the central INSPIRE registry:

- **Register owner:** European Union
- **Register & registry manager:** European Commission, Joint Research Centre
- **Submitting organisations:** Each country represented in the MIG shall nominate a submitting organisation, typically an organisation representing the country in the MIG-T or another organisation involved in the coordination of the INSPIRE implementation in that country. In addition, the 2016.4 sub-group, the EEA, the JRC, and DG Environment shall be submitting organisations.
- **Control body:** The members of the control body shall be selected by the INSPIRE MIG, in agreement with the Commission, from the INSPIRE pool of experts and the representatives of the INSPIRE MIG.
- **Register user:** anyone

## 4.2.2 Best Practice 2: Use resolvable HTTP(S) URIs as identifiers for registers and register items

Identify each register and register item by a carefully chosen, persistent and resolvable URI.

### Why

Adopting a common identification system enables basic data identification and comparison processes by any stakeholder in a reliable way. They are an essential pre-condition for proper data management and reuse.

Developers may build URIs into their code and therefore it is important that those URIs persist and that they resolve to the same resource over time without the need for human intervention.

### Intended Outcome

Registers and register items can be consistently referenced through time, regardless of the status, availability or format of the registers and register items.

### Possible Approach to Implementation

To be persistent, URIs must be designed as such. A lot has been written on this topic, see, for example, the European Commission's Study on Persistent URIs [**PURI**] which in turn links to many other resources.

Where a data provider is unable or unwilling to manage a URI space (under a certain domain) directly for persistence, an alternative approach is to use a redirection service such as Permanent Identifiers for the Web or purl.org. These provide persistent URIs that can be redirected as required so that the eventual location can be ephemeral. The software behind such services is freely available so that it can be installed and managed locally if required.

Digital Object Identifiers (DOIs) offer a similar alternative. These identifiers are defined independently of any Web technology but can be appended to a 'URI stub.' DOIs are an important part of the digital infrastructure for research data and libraries.

#### Example

The INSPIRE themes register is identified by the following HTTP URI:

<http://inspire.ec.europa.eu/theme>

The register item "Administrative Units" in the theme register is identified by the following HTTP

URI: <http://inspire.ec.europa.eu/theme/au>

#### See also

- [Best Practice 9](#): Use persistent URIs as identifiers of datasets [**W3C DWBP**]
- [Best Practice 10](#): Use persistent URIs as identifiers within datasets [**W3C DWBP**]

### 4.2.3 Best Practice 3: Use item classes

Organize the different elements contained in a registry using item classes: an item class is a set of items with common properties (or attributes).

#### Why

Defining an item class, helps creating groups of items with the same set of properties. A register could contain items with different sets of properties (e.g. the INSPIRE code list register contains code lists and code list values which have different properties). Organizing the items contained inside the same register in item classes helps keeping items with the same set of properties grouped. In this way the item type can be easily distinguished inside a register.

#### Intended Outcome

Items with the same set of properties are organized under the same item class inside a register.

#### Possible Approach to Implementation

For each register, identify the group of items having the same set of properties. Each group is an item class. The item class can also contain a hierarchy.

#### Example

The hierarchical INSPIRE code list register contains two item classes, each with its own specific attributes:

- Code list (containing e.g. information about the extensibility)
- Code list value

#### 4.2.4 Best Practice 4: Use well-defined statuses

Define a list of statuses for the elements: items shall be individually managed, moving through a set of well-defined states.

##### Why

Items inside a register can change over time. These changes may include simple modifications, bigger changes involving semantic modifications or even the supersession by other item(s), the retirement or the end of the validity of a specific item.

Keeping the status of the item helps understanding its validity.

##### Intended Outcome

Register users can understand the status of each register item, e.g. whether it is valid (i.e. can be used), proposed (i.e. should be used with caution), deprecated or superseded (i.e. should no longer be used).

##### Possible Approach to Implementation

Add to the items a field to specify the status. The status should be an URI pointing to the defined status register.

##### Example

The central INSPIRE registry<sup>4</sup> uses the following status values:

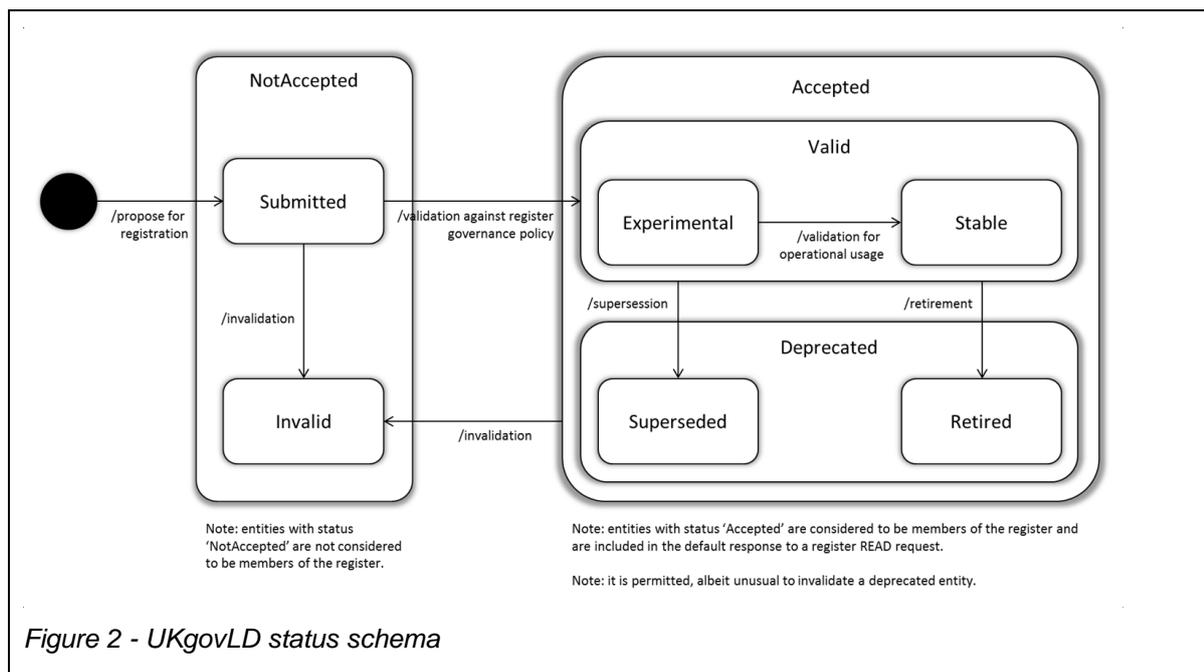

- submitted: The item has been entered into the register, but the control body has not accepted the proposal to add it.
- valid: The item has been accepted, is recommended for use, and has not been superseded or retired.
- invalid: A decision has been made that a previously valid register item contains a substantial error and is invalid, and will normally have been replaced by a corrected item.
- retired: A decision has been made that the item is no longer recommended for use. It has not been superseded by another item.
- superseded: The item has been superseded by another item and is no longer recommended for use.

The UKGovLD registry proposes the following hierarchical list of status values:

- notAccepted – corresponds to ISO 19135:2005 'notValid'
  - submitted – corresponds to ISO 19135:(draft) 'submitted'
  - reserved – flags a reserved entry, same semantics as submitted
  - invalid – corresponds to ISO 19135:(draft) 'invalid'
- accepted
  - valid – corresponds to ISO 19135:2005 'valid'
    - experimental - the item is being trialed and might be withdrawn or replaced
    - stable – no change is currently anticipated
  - deprecated
    - superseded – corresponds to ISO 19135:2005 'superseded'
    - retired – corresponds to ISO 19135:2005 'retired'

---

<sup>4</sup> INSPIRE registry – <http://inspire.ec.europa.eu/registry>

#### 4.2.5 Best Practice 5: Do not delete items

Once the elements are entered in a registry/register, they shall not be deleted in order to maintain the consistency of the registry. Instead of deleting items, a status that states the element as retired or invalid shall be used.

##### Why

URI dereferencing is the primary interface to data on the Web. If dereferencing a URI leads to the infamous 404 response code (Not Found), the user will not know whether the lack of availability is permanent or temporary, planned or accidental. If the publisher, or a third party, has archived the data, that archived copy is much less likely to be found if the original URI is effectively broken.

##### Intended Outcome

The URI of an element inside a registry system will always dereference to the element or redirect to information about it.

##### Possible Approach to Implementation

Instead of deleting items, a status that states the element as retired or invalidated shall be used.

##### Example

An example item which is no longer valid but still has a resolvable URI is the "Gazetteer" (<http://inspire.ec.europa.eu/featureconcept/Gazetteer>) item in the INSPIRE feature concept dictionary.

##### See also

- [Best Practice 27: Preserve identifiers \[W3C DWBP\]](#)

#### 4.2.6 Best Practice 6: Provide registers in different formats

Make registers available in multiple formats. HTML should be provided for human consumption, and at least one machine readable format should be provided in order to enable programmatic access and exchange of information. Machine-readable formats should re-used existing standard vocabularies, e.g. SKOS Simple Knowledge Organization System [SKOS] or the Data Catalog Vocabulary (DCAT) [DCAT].

##### Why

Providing data in more than one format reduces costs incurred in data transformation. It also minimizes the possibility of introducing errors in the process of transformation. If many users need to transform the data into a specific data format, publishing the data in that format from the beginning saves time and money and prevents errors many times over. Lastly it increases the number of tools and applications that can process the data.

##### Intended Outcome

As many users as possible will be able to use the register content without first having to transform it into their preferred format.

##### Possible Approach to Implementation

Consider the data formats most likely to be needed and consider alternatives that are likely to be useful in the future. Data publishers must balance the effort required to make the data available in many formats against the cost of not doing so, but providing at least one alternative will greatly increase the usability of the data. In order to serve data in more than one format you can use content negotiation as described in Best Practice 7.

##### Example

The central INSPIRE registry provides multiple formats, including (custom and ISO 19135-1) XML, RDF/XML, JSON, ATOM and CSV.

##### See also

- [Best Practice 14](#): Provide data in multiple formats [W3C DWBP]
- [Best Practice 15](#): Reuse vocabularies, preferably standardized ones [W3C DWBP]

#### 4.2.7 Best Practice 7: Use content negotiation for serving registers available in multiple formats

Use content negotiation in addition to file extensions for serving data available in multiple formats.

##### Why

As the Architecture of the Web<sup>5</sup> and DCAT [DCAT] make clear, a resource, such as a dataset, can have many representations. The same data might be available as JSON, XML, RDF, CSV and HTML (see

Best Practice 6: Provide registers in different formats). These multiple representations can be made available via an API but should be made available from the same URL using content negotiation to return the appropriate representation (what DCAT calls a distribution). Specific URIs can be used to identify individual representations of the data directly, by-passing content negotiation.

##### Intended Outcome

Content negotiation<sup>6</sup> will enable different resources or different representations of the same resource to be served according to the request made by the client.

---

<sup>5</sup> Architecture of the Web - <https://www.w3.org/TR/dwbp/#bib-WEBARCH>

### Possible Approach to Implementation

A possible approach to implementation is to configure the Web server to deal with content negotiation of the requested resource.

The specific format of the resource's representation can be accessed by the URI or by the Content-type of the HTTP Request.

### Example

The central INSPIRE registry supports content-negotiation. Different representations of the items can be served according to the content type specified in the `Accept:` header of the HTTP Request.

The example below shows the call to the same resource with two different formats (XML and RDF/XML).

```
GET http://inspire.ec.europa.eu/theme/ad HTTP/1.1
Accept: application/xml
...
```

```
GET http://inspire.ec.europa.eu/theme/ad HTTP/1.1
Accept: application/rdf+xml
...
```

### See also

- [Best Practice 19](#): Use content negotiation for serving data available in multiple formats [W3C DWBP]

## 4.2.8 Best Practice 8: Provide registers in different languages

Provide registry and registers in all the languages that are available in the specific national context. In a European context, it may also be useful to provide the registry and register data in English.

### Why

The availability of all the languages used in a national context will increase the usability of the registry system. In addition, the availability of a commonly used language such as English, will allow also foreign users to access the information available in the registry.

### Intended Outcome

As many users as possible will be able to access the register content in their preferred language.

### Possible Approach to Implementation

The registry system shall provide a mechanism to select the available languages and to provide the registry content in the selected language.

### Example

The central INSPIRE registry is an example of a registry system that provide the information in multiple languages.

---

<sup>6</sup> Content negotiation are mechanisms defined as a part of HTTP that make it possible to serve different representations of a resource at the same URI, so that user applications can specify which representation fits their capabilities the best.

### 4.3 Register reuse (extensions, sub-sets and profiles)

Items from one register can be reused in another register in order to support specific thematic, application or national requirements. We use the term profile<sup>7</sup> here for a register that contains additional items, a subset of items, or a combination of both or a register that reuses all items from the original register 1:1 (Figure 3).

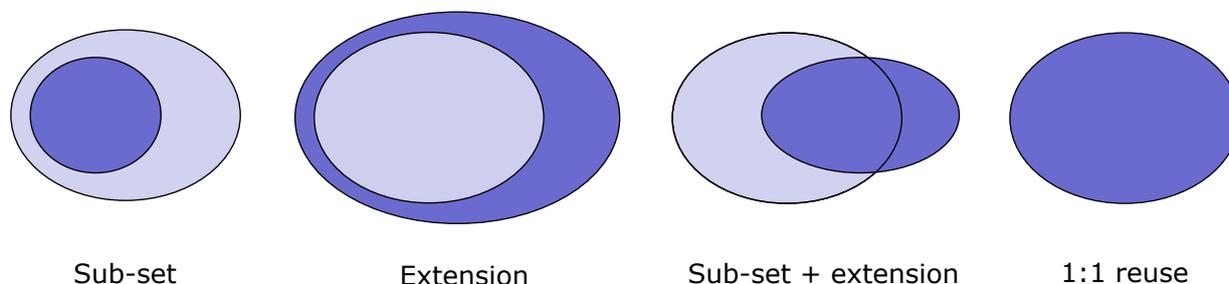

Figure 3 – Different types of register profiles. The original register is shown in light blue, the register profile in dark blue.

When creating a profile, a dependency is created between the original register and the profile, since any changes to reused items occurring in the original register should also be reflected in the profile. Such a dependency is expressed using the `voaf:reliesOn` relationship [VOAF] in the register descriptor (see section 6.1.2).

In order to have a complete context of the elements available in the profile, it should include any reused items from the original register and any new items defined in this register.

If register A is a profile of register B, register A should include all the items from register B that are reused in A, in addition to any new items defined in register A (see TG Recommendation 3 in section 6.3.2).

**EXAMPLE** If A is a simple sub-set of B, it simply contains all items from B that are to be reused in A. For example, the EIONET air quality reporting guidelines restrict the values to be used for the Media code list (<http://inspire.ec.europa.eu/codelist/MediaValue>) containing the values *air*, *biota*, *landscape*, *sediment*, *soil/ground*, *waste* and *water* to only the value *air*.

air
biota
landscape
sediment
soil/ground
waste
water

Values in the original register  
<http://inspire.ec.europa.eu/codelist/MediaValue>

air
-----

Value in the sub-set  
<http://dd.eionet.europa.eu/vocabulary/inspire/MediaValue>

<sup>7</sup> According to [ISO 19106], a profile is a set of one or more base standards or subsets of base standards (...) that are necessary for accomplishing a particular function”, but can also “include extensions within the context permitted in the base standard”.

**EXAMPLE** If A is a simple extension of B, it contains all items from B plus additional items that are to be used in A. For example, the GeoSmartCities project has extended the INSPIRE Current Use code list (<http://inspire.ec.europa.eu/codelist/CurrentUseValue>), with narrower (more specific) values of building use (e.g. *postOffice* or *policeStation*) in their extended code list (<http://hub.geosmartcity.eu/registry/codelist/CurrentUseValue/>).

There are two possible implementation scenarios for extension, as described below.

#### 4.3.1 Harvesting scenario

In this scenario, the elements coming from the original register are repeated in the extension register. This can be achieved e.g. by regularly retrieving (or "harvesting") the relevant values and their descriptions from the original register and storing them in the extended register.

**Pro:** all the information of the original items is available in the extension register, without the need to go to the original register to access them.

**Cons:** if the information contained in the original register changes, the data stored in the extension register are inconsistent: the harvesting should be performed frequently enough to ensure consistency.

#### 4.3.2 Reference scenario

In this scenario, the elements coming from the original register are just listed as references in the extension register (e.g. a URI with the link to the item in the original register).

**Pro:** the information on the re-used items is always up-to-date, there is no need for a harvesting procedure.

**Cons:** the extension register will not store any details of the referenced item except for the URI; any additional information (e.g. label, description) needs to be retrieved on the fly by the registry application providing the extension register or is only available to users after retrieving the resource provided at the given URI.

## 5 The INSPIRE register federation

The INSPIRE register federation<sup>8</sup> is a distributed federation of registers related to the INSPIRE Directive.

The European Commission is operating a central registry providing common INSPIRE registers [**INS REG**], e.g. to manage INSPIRE code lists or themes. Where Member States extend these code lists, they are obliged to make available the extended values in local registers (see section 0). Such local registers can also support other use cases, e.g. the management of organisations in a country that has to implement INSPIRE, or thematic vocabularies, such as those provided by EU institutions and bodies.

In general, registers are useful in all situations where, by a reference code rather than free text, in data exchange, ambiguities or inconsistencies can be avoided. Also registers can facilitate the internationalisation of user interfaces by providing multilingual labels.

One of the aims of the MIWP-6 sub-group (MIWP-6) was therefore to investigate how European, national or community registers and the links between them can be published in and accessed through a *register federation* for INSPIRE.

The action also worked on setting up a central access point to the INSPIRE register federation, the *Register of Registers (RoR)*, that allows to browse, search and access the different elements available in the federation. The RoR provides information about the registers included in the federation and the relationships between them, and allows searching for registers and the items contained in them. The RoR can be accessed using the RoR's graphical user interface or API, both of which are publicly accessible.

### 5.1 Why a register federation?

The aim of the INSPIRE register federation is to connect and make accessible through a central access point all registers that are being set up in Member States (at different levels of administration) and in thematic communities to support the implementation of INSPIRE. Through the federation, it should become easy to search and browse all INSPIRE-related reference codes and controlled vocabularies across the registry systems used for managing them.

The federation can be crucial for implementers that want to create extensions (of INSPIRE data models or code lists). Through the federation, it becomes easy to find similar extensions that other implementers have already created. Thus, the federation could help avoid repetition of work and promote convergence.

The federation will also prove useful for coordinators of national or thematic implementation programmes. When setting up new registers, e.g. of the organisations responsible for INSPIRE implementation in a country, the register federation makes it possible to find similar registers already existing in other countries. Again, this could help avoid repetition of work and promote convergence.

For register managers, the federation may be useful for understanding and properly managing the relationships between their registers and those of other organisations, in particular the central INSPIRE registry or between registers at regional and at national level.

---

<sup>8</sup> INSPIRE register federation – <http://inspire-regadmin.jrc.ec.europa.eu/ror/help.jsp>

## 5.2 Architecture and interactions

The RoR is the central component of the INSPIRE Register Federation. It allows the registration, management, visualization and retrieval of the elements contained in different registries and registers. The RoR maintains a central index where all of the registered information is structured, organised and made available.

It is important to note that the RoR does not store all the information of the federated registries/registers, but only basic information (such as the identifier, label and description). The RoR browsing and searching interface provides basic information on the elements contained in the federation, but redirects to the representation of the resource in its source registry in order to get the full information.

The architecture of the federation and the interaction with the RoR can be broken down into three basic parts (see Figure 4 and Figure 5):

- **Registration:** A register/registry manager shares their registry/registers in the federation by registering them in the RoR using an agreed set of descriptive metadata. In the context of the register federation, the data formats for these descriptions are called *registry/register descriptors*.
- **Indexing:** The RoR creates a search index based on the information provided by the register/registry on the registries and registers.
- **Browsing/searching:** Once the information has been organised in the RoR, it can be accessed using the web interface, e.g. it can be searched (using the search index) or browsed through the RoR's web user interface or accessed using the RESTful API provided by the RoR.

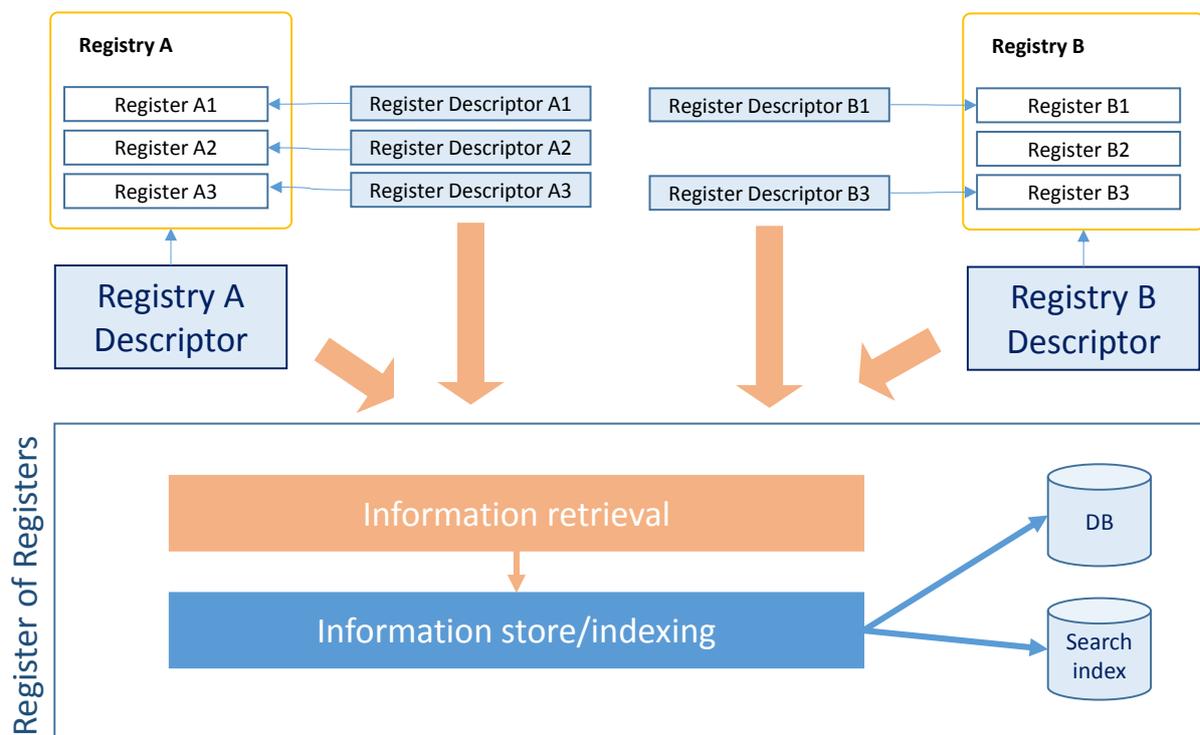

Figure 4 - RoR architecture – information retrieval and indexing

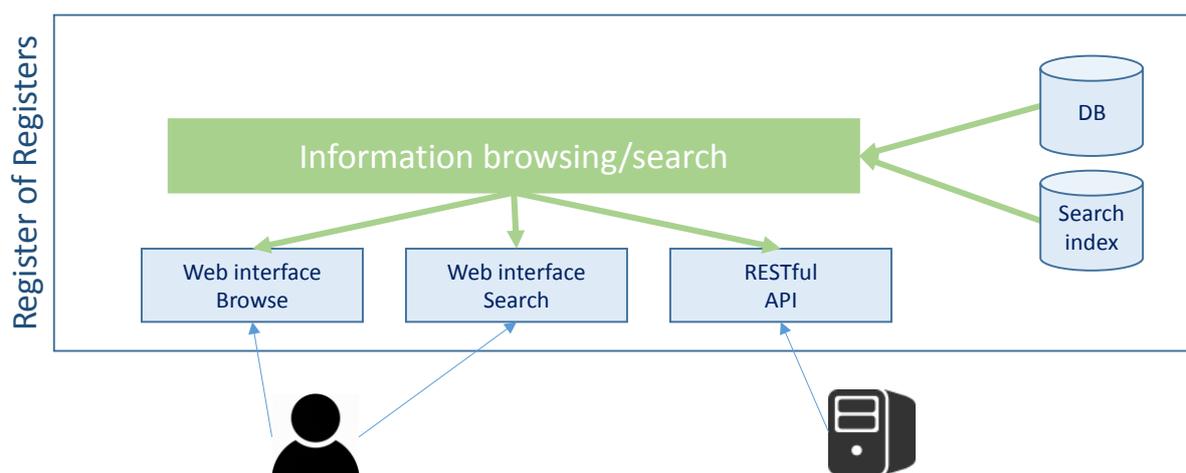

Figure 5 - RoR architecture – browsing and search

### 5.3 RoR data model

The RoR data model can be split in three main components:

- the *registries* present in the federation
- the *registers* present in the federation
- the *relations* between the registers.

All of the information on the items available in these registers are provided through the relevant descriptor file (see section 6 for details). The RoR only stores a minimum set of information needed to support the browsing and federated search functionality (detailed in section 7.2). The RoR uses the centrally stored information on the extensions to find the results and return them to the user. Thus, the RoR can be used as a “search engine” for information about registries, registers and relation in the federation.

The complete information about each item are not stored in the RoR, but are instead available in the related registry/register.

Figure 6 shows a simplified representation of the RoR data model.

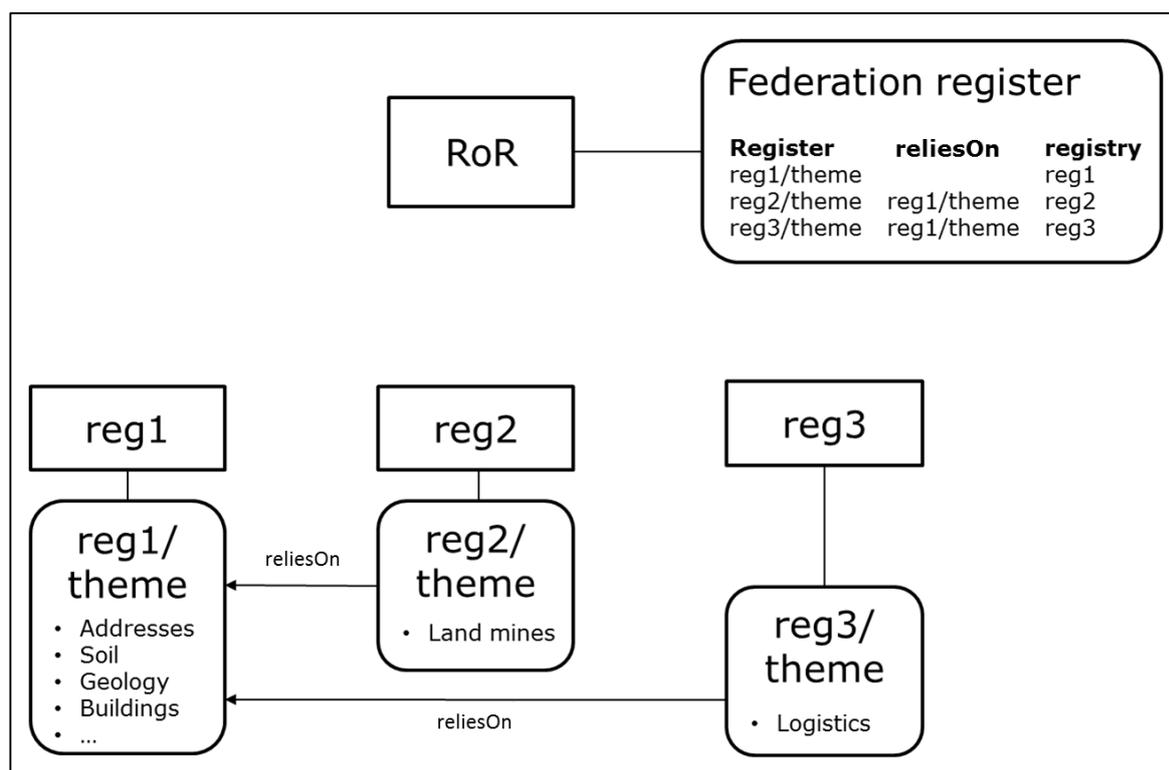

Figure 6 - Simplified RoR data model

The following tables describe the data model for each of the RoR's registers / item classes in more detail.

NOTE Some attributes may be empty (contain NULL values), depending on the information provided by the submitting organisations. See section 6 for the mandatory and optional data elements to be provided in the registry and register descriptors.

Table 2 - Registry

Attribute	Type	Description
registry id	uuid	Internal id of the registry
URI	string	The URI of the registry
label	string	The name of the registry
definition	string	The definition of the registry
publisher name	string	The name of the publisher (organisation)
publisher e-mail	string	A contact e-mail for the publisher
publisher URI	string	The URI of the publisher
publisher homepage	string	The homepage of the publisher
descriptor	string	The URL of the registry descriptor
update frequency	string	The harvesting frequency
creation date	date	The date when the item has been created
date of last update	date	The date when the item has been last updated

Table 3 - Register

Attribute	Type	Description
register id	uuid	Internal id of the register
URI	string	The URI of the register
registry	uuid	The registry containing this register
label	string	The name of the register
definition	string	The definition of the register
publisher name	string	The name of the publisher (organisation)
publisher e-mail	string	A contact e-mail for the publisher
publisher URI	string	The URI of the publisher
publisher homepage	string	The homepage of the publisher
descriptor	string	The URL of the register descriptor
update frequency	string	The harvesting frequency
creation date	date	The date when the item has been created
date of last update	date	The date when the item has been last updated

Table 4 - Relation

Attribute	Type	Description
relation id	uuid	Internal id of the relation
subject	uuid	The subject of the relation
object	uuid	The object of the relation
predicate	string	The type of the relation (predicate)
creation date	date	The date when the item has been created
date of last update	date	The date when the item has been last updated

## 6 How to join the INSPIRE Register Federation

In order to share a registry in the INSPIRE Register Federation, the responsible registry or register manager needs to publish a descriptor of the registry and register it in the RoR administration section. The registry descriptor shall contain the list of registers to be shared in the federation, with the reference to each register descriptor.

The descriptors need to fulfil a number of requirements for interoperability in the federation. These requirements are structured into three conformance classes:

- **Core:** This conformance class requires the minimum information for the RoR to register the registry and registers in the federation.
- **Automatic Harvesting:** This conformance class requires the information to enable the automatic harvesting of the information.
- **Content:** This conformance class requires information in order to provide complete content related to each resource.

Only the Core conformance class is required for all registries/registers that want to join the federation. The other two conformance classes are optional.

**NOTE** To claim conformity with any of the conformance classes, all requirements contained in them, need to be met.

The following paragraphs will describe the required/recommended fields to be provided for each of the classes and the format to create the descriptors.

The idea of the descriptors is to provide metadata and data about the registries and registers to be included in the federation in a RDF/XML document (subsequently called "Registry descriptor" or "Register descriptor") that is publicly available through an HTTP(S) URI.

The proposed approach is as follows:

- The W3C Data Catalog vocabulary [**DCAT**] is used to model entity *registry* (`dcat:Catalog`).
- The W3C Simple Knowledge Organization System [**SKOS**] is used to model entities *register* (`skos:ConceptScheme`) and *item* (`skos:Concept`).

The tables provided below list the fields for each of the conformance classes and the descriptors. The cardinality related to each field determine if the field is mandatory. In case it is not mandatory, it should be provided if available.

### 6.1 Core conformance class

This conformance class is required for sharing registry and register metadata in the federation.

#### **TG Conformance Class:** Core

*This conformance class is inclusive of:*

*TG Requirement 1 to TG Requirement 11*

*TG Recommendation 1 to TG Recommendation 2*

Complete example files related to this conformance class are available in Annex A.1.

### 6.1.1 Registry descriptor

**TG Requirement 1** Metadata about the registry to be included in the federation shall be specified in a RDF/XML document (*Registry descriptor*) that is publicly available through an HTTP(S) URI.

**TG Requirement 2** The URIs/URLs in the *Registry descriptor* shall be provided using the absolute format, without abbreviation.

**NOTE** Even if the RDF Specification allows the use of the `xml:base` property to allow URI/URL abbreviation, there are cases in which some parsers/software are not able to handle it.

**EXAMPLE** Absolute and abbreviated URLs

```
<!-- Absolute URL -->
...
<rdf:Description rdf:about="http://inspire.ec.europa.eu/registry">
...

```

```
<!-- Abbreviated URL using xml:base (not supported) -->
<rdf:RDF
  xmlns:dcat="http://www.w3.org/ns/dcat#"
  xml:base="http://inspire.ec.europa.eu"
  ...
<rdf:Description rdf:about="/registry">
...

```

**TG Requirement 3** The registry shall be described as an instance of `dcat:Catalog` class with the following mandatory/optional properties.

Property	Cardinality	Range	Notes
<code>dct:title</code>	1..1	<code>rdfs:Literal</code>	The name of the registry
<code>dct:publisher</code>	1..1	<code>foaf:Agent</code>	The publisher of the registry

**EXAMPLE** Structure of a registry descriptor

```
<?xml version="1.0" encoding="UTF-8"?>
<rdf:RDF
  xmlns:dcat = "http://www.w3.org/ns/dcat#"
  xmlns:dct  = "http://purl.org/dc/terms/"
  xmlns:foaf = "http://xmlns.com/foaf/0.1/"
  xmlns:rdf  = "http://www.w3.org/1999/02/22-rdf-syntax-ns#"
>

<!-- URI / URL of the registry -->
  <rdf:Description rdf:about="http://inspire.ec.europa.eu/registry">
    <rdf:type rdf:resource="http://www.w3.org/ns/dcat#Catalog"/>

<!-- Name of the registry -->
    <dct:title xml:lang="en">INSPIRE registry</dct:title>
  </rdf:Description>
</rdf:RDF>

```

```

<!-- Registry publisher / responsible / contact point -->
  < dct:publisher>
    [...]
  </ dct:publisher>

</ rdf:Description>
</ rdf:RDF>

```

**TG Requirement 4** The publisher shall be described as instances of `foaf:Agent` class with the following mandatory/optional properties.

Property	Cardinality	Range	Notes
<code>foaf:name</code>	1..1	<code>rdfs:Literal</code>	The name of the publisher organization
<code>foaf:mbox</code>	1..1	URI	The e-mail of the publisher organization
<code>foaf:homepage</code>	0..1	URL	The home page of the publisher organization

**TG Recommendation 1** The URI of the `foaf:Agent` should be taken from an organisation register or provided using a URI well-defined URI pattern.

EXAMPLE Some examples are provided below:

- URI identifying the "European Commission, Joint Research Centre" in the EU Publications Office's corporate body register<sup>9</sup>: <http://publications.europa.eu/resource/authority/corporate-body/JRC>
- URI identifying National Geographic Institute Belgium in DBpedia: [http://dbpedia.org/resource/National\\_Geographic\\_Institute\\_\(Belgium\)](http://dbpedia.org/resource/National_Geographic_Institute_(Belgium))

EXAMPLE Description of the publisher "European Commission, Joint Research Centre"

```

< dct:publisher>
  < foaf:Agent
rdf:about="http://publications.europa.eu/resource/authority/corporate-body/JRC">
    < foaf:name xml:lang="en">European Commission, Joint Research
Centre</ foaf:name>
    < foaf:mbox rdf:resource="mailto:inspire-registry-dev@jrc.ec.europa.eu"/>
    < foaf:homepage rdf:resource="https://ec.europa.eu/jrc"/>
  </ foaf:Agent>
</ dct:publisher>

```

<sup>9</sup> <http://publications.europa.eu/mdr/resource/authority/corporate-body/html/corporatebodies-eng.html>

**TG Requirement 5** For each register to be federated, the *Registry descriptor* shall include a reference to the document providing the register metadata (the *Register descriptor*).

**TG Requirement 6** The reference to the register shall be described with the `dcat:dataset` property. The `dcat:distribution` property shall be included with the following properties.

**NOTE** The system will check the *Register descriptor* is available at the given URI through an HTTP GET request to the URI with the HTTP Accept header set to "application/x-ror-rdf+xml". Otherwise it will ask for the resource using the standard HTTP GET request without an Accept header.

Property	Cardinality	Range	Notes
<code>dct:format</code>	1..1	URI	The format shall be the following value from the "file type" code list provided by the EU Publication office: <a href="http://publications.europa.eu/resource/authority/file-type/RDF_XML">http://publications.europa.eu/resource/authority/file-type/RDF_XML</a>
<code>dcat:downloadUrl</code>	1..1	URL	

#### EXAMPLE

```
<dcat:dataset>
  <rdf:Description rdf:about="http://inspire.ec.europa.eu/theme">
    <dcat:distribution rdf:parseType="Resource">
      <dct:format
rdf:resource="http://publications.europa.eu/resource/authority/file-type/RDF_XML"/>
      <dcat:downloadURL rdf:resource="http://inspire.ec.europa.eu/theme"/>
    </dcat:distribution>
  </rdf:Description>
</dcat:dataset>
```

### 6.1.2 Register descriptor

**TG Requirement 7** Metadata about the register to be included in the federation shall be specified in a RDF/XML document (*Register descriptor*) that is publicly available through an HTTP(S) URI.

**TG Requirement 8** The URIs/URLs in the *Register descriptor* shall be provided using the absolute format, without abbreviation.

**NOTE** Even if the RDF Specification allows the use of the `xml:base` property to allow URI/URL abbreviation, there are cases in which some parsers/software are not able to handle it.

**TG Requirement 9** The *register* shall be described as an instance of `skos:ConceptScheme` class with the following mandatory/optional properties.

Property	Cardinality	Range	Notes
<code>skos:prefLabel</code>	1..*	<code>rdfs:Literal</code>	The label of the register <sup>10</sup>
<code>voaf:reliesOn</code>	0..*	URI	The URI of a <i>register</i> on which this <i>register</i> relies on <sup>11</sup>
<code>dct:publisher</code>	1..1	<code>foaf:Agent</code>	The publisher of the register
<code>dct:isPartOf</code>	1..1	<code>dcat:Catalog</code>	The reference to the <i>registry</i> containing this <i>register</i> .

**TG Requirement 10** The *registry* containing this *register* shall be described as an instance of `dcat:Catalog`.

## EXAMPLE

```
<?xml version="1.0" encoding="UTF-8"?>
<rdf:RDF xmlns:adms="http://www.w3.org/ns/adms#"
  xmlns:dcat="http://www.w3.org/ns/dcat#"
  xmlns:dct="http://purl.org/dc/terms/"
  xmlns:foaf="http://xmlns.com/foaf/0.1/"
  xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns#"
  xmlns:skos="http://www.w3.org/2004/02/skos/core#"
  xmlns:voaf="http://purl.org/vocommons/voaf#"
  <!-- URI / URL of the register -->
  <rdf:Description
    rdf:about="http://dd.eionet.europa.eu/vocabulary/inspire/DesignationSchemeValue">
    <rdf:type rdf:resource="http://www.w3.org/2004/02/skos/core#ConceptScheme"/>
    <!-- Reference to the registry operating the register -->
    <dct:isPartOf>
      <dcat:Catalog rdf:about="http://dd.eionet.europa.eu/vocabularies"/>
    </dct:isPartOf>
    <!-- Reference to the external register on which this register relies on -->
    <voaf:reliesOn
    rdf:resource="http://inspire.ec.europa.eu/codelist/DesignationSchemeValue"/>
    <!-- Name of the register -->
    <skos:prefLabel xml:lang="en">Designation Scheme</skos:prefLabel>
    <!-- Register publisher / responsible / contact point -->
    <dct:publisher>
      [...]
    </dct:publisher>
  </rdf:Description>
</rdf:RDF>
```

<sup>10</sup> It is possible to specify more than one `skos:prefLabel` element, one per language. However, at the time of writing, the RoR does not support multilinguality. Therefore, if available, the English `skos:prefLabel` element (`xml:lang="en"`), or else the first `skos:prefLabel` element, will be used. If requirements emerge for multilingual support, this can be added at a later stage.

<sup>11</sup> At the time of writing, the RoR only supports dependencies on *one* register. If requirements emerge to relax this requirement, support for dependencies on multiple registers can be added at a later stage.

**TG Requirement 11** The publisher shall be described as instances of `foaf:Agent` class with the following properties.

Property	Cardinality	Range	Notes
<code>foaf:name</code>	1..1	<code>rdfs:Literal</code>	The name of the publisher organisation
<code>foaf:mbox</code>	1..1	URI	The e-mail of the publisher organisation
<code>foaf:homepage</code>	0..1	URL	The home page of the publisher organisation

**TG Recommendation 2** The URI of the `foaf:Agent` should be taken from an organisation register or provided using a URI well-defined URI pattern.

EXAMPLE Some examples are provided below:

- URI identifying the "European Commission, Joint Research Centre" in the EU Publications Office's corporate body register<sup>12</sup>: <http://publications.europa.eu/resource/authority/corporate-body/JRC>
- URI identifying National Geographic Institute Belgium in DBpedia: [http://dbpedia.org/resource/National\\_Geographic\\_Institute\\_\(Belgium\)](http://dbpedia.org/resource/National_Geographic_Institute_(Belgium))

## 6.2 Automatic harvesting conformance class

Registries/registers compliant with this conformance class can be automatically harvested from the Register of Registers.

**TG Conformance Class:** Automatic harvesting

*This conformance class is inclusive of:*

*TG Requirement 12 to TG Requirement 13*

Complete example files related to this conformance class are available in Annex A.2.

<sup>12</sup> <http://publications.europa.eu/mdr/resource/authority/corporate-body/html/corporatebodies-eng.html>

## 6.2.1 Registry descriptor

**TG Requirement 12** In addition to the properties specified in the Core conformance class, the *Registry descriptor* shall provide the following property.

Property	Cardinality	Range	Notes
dct:accrualPeriodicity	1..1	URI	Update frequency. For conformance with DCAT-AP, this needs to be specified by using the MDR Frequency register maintained by the EU Publications Office: <a href="http://publications.europa.eu/mdr/resource/authority/frequency/html/frequencies-eng.html">http://publications.europa.eu/mdr/resource/authority/frequency/html/frequencies-eng.html</a> -  EXAMPLE <a href="http://publications.europa.eu/resource/authority/frequency/DAILY">http://publications.europa.eu/resource/authority/frequency/DAILY</a>  NOTE The minimum frequency is "daily".

EXAMPLE Daily update frequency

```
<dct:accrualPeriodicity
rdf:resource="http://publications.europa.eu/resource/authority/frequency/DAILY"/>
```

## 6.2.2 Register descriptor

**TG Requirement 13** In addition to the properties specified in the Core conformance class, the *Register descriptor* shall provide the following property.

Property	Cardinality	Range	Notes
dct:accrualPeriodicity	1..1	URI	Update frequency. For conformance with DCAT-AP, this needs to be specified by using the MDR Frequency register maintained by the EU Publications Office: <a href="http://publications.europa.eu/mdr/resource/authority/frequency/html/frequencies-eng.html">http://publications.europa.eu/mdr/resource/authority/frequency/html/frequencies-eng.html</a>  EXAMPLE <a href="http://publications.europa.eu/resource/authority/frequency/DAILY">http://publications.europa.eu/resource/authority/frequency/DAILY</a>  NOTE The minimum frequency is "daily".

## 6.3 Content conformance class

Registries/registers compliant with this conformance class can also share their register items in the federation, e.g. to make them searchable in the Register of Registers and accessible from register clients (incl. other registers).

### **TG Conformance Class:** Content

*This conformance class is inclusive of:*

*TG Requirement 14 to TG Requirement 17*

*TG Recommendation 3*

Complete example files related to this conformance class are available in Annex A.3.

### 6.3.1 Registry descriptor

**TG Requirement 14** In addition to the properties specified in the Core conformance class, the *Registry descriptor* shall provide the following property.

Property	Cardinality	Range	Notes
dct:description	1..1	rdfs:Literal	The description of the registry

### 6.3.2 Register descriptor

**TG Requirement 15** In addition to the properties specified in the Core conformance class, the *Register descriptor* shall provide the following property.

Property	Cardinality	Range	Notes
skos:definition	1..1	rdfs:Literal	The definition of the register

**TG Recommendation 3** If register A is a profile of register B, register A should include all the items from register B that are reused in A, in addition to any new items defined in register A.

**TG Requirement 16** The *Register descriptor* shall describe each of the *items* defined inside the register as a `skos:Concept` with the following properties.

NOTE These items are also referred to as "internally defined items" in this document.

Property	Cardinality	Range	Notes
skos:inScheme	1..1	URI	Reference to the register containing the item (see example below)
skos:prefLabel	1..1	rdfs:Literal	The label of the item
skos:definition	0..1	rdfs:Literal	The definition of the item
adms:status	0..1	URI	The code list to be used for the status is the one provided by the INSPIRE registry: <a href="http://inspire.ec.europa.eu/registry/status">http://inspire.ec.europa.eu/registry/status</a>

EXAMPLE Definition of an internally defined item (`nationalDesignationTypeCategory`).

```
<?xml version="1.0" encoding="UTF-8"?>
<rdf:RDF xmlns:adms="http://www.w3.org/ns/adms#" [...] >
  <rdf:Description
rdf:about="http://dd.eionet.europa.eu/vocabulary/inspire/DesignationSchemeValue">
    <rdf:type rdf:resource="http://www.w3.org/2004/02/skos/core#ConceptScheme"/>

    [...]

  </rdf:Description>

  <rdf:Description
rdf:about="http://dd.eionet.europa.eu/vocabulary/inspire/DesignationSchemeValue/nationalDesignationTypeCategory">
    <rdf:type rdf:resource="http://www.w3.org/2004/02/skos/core#Concept"/>
    <skos:inScheme
rdf:resource="http://dd.eionet.europa.eu/vocabulary/inspire/DesignationSchemeValue"/>
    <skos:prefLabel xml:lang="en">National designation type
category</skos:prefLabel>
    <skos:definition xml:lang="en">The designation type category according to the
codes (A, B or C) used in appendix D of the Natura 2000 Standard Data Form
(Protection status categories in each Member State at national and regional level).
The same designation type categories are also used by the Emerald network.
Important note: This code value is an extension to INSPIRE PS - code-list
DesignationSchemeValue</skos:definition>
    <adms:status
rdf:resource="http://inspire.ec.europa.eu/registry/status/valid"/>
  </rdf:Description>

  [...]

</rdf:RDF>
```

**TG Requirement 17** The *Register descriptor* shall include each of the *items* reused from another register with the following property.

NOTE These items are originally defined in the register from which they are taken and are therefore also referred to as "externally defined items" in this document.

Property	Cardinality	Range	Notes
----------	-------------	-------	-------

skos:inScheme	1..*	URI	Reference to the register containing the item (see example below)
---------------	------	-----	---

**NOTE** The externally defined items may be provided to specify that this register is using a subset of the elements from the external register. In this case, the register would only include externally defined items and no internally defined ones.

**EXAMPLE** If a certain application only deals with environmental monitoring stations for air measurements, a profile of the *media* code list (<http://inspire.ec.europa.eu/codelist/MediaValue>) could be created for this application that would contain only the value <http://inspire.ec.europa.eu/codelist/MediaValue/air>.

```
<?xml version="1.0" encoding="UTF-8"?>
<rdf:RDF xmlns:adms="http://www.w3.org/ns/adms#" [...] >
  <rdf:Description rdf:about="http://my-air-app.eu/MediaValue">
    <rdf:type rdf:resource="http://www.w3.org/2004/02/skos/core#ConceptScheme"/>
    [...]
    <voaf:reliesOn
rdf:resource="http://inspire.ec.europa.eu/codelist/MediaValue"/>
    [...]
  </rdf:Description>
  <rdf:Description
rdf:about="http://inspire.ec.europa.eu/codelist/MediaValue/air">
    <rdf:type rdf:resource="http://www.w3.org/2004/02/skos/core#Concept"/>
    <skos:inScheme rdf:resource="http://my-air-app.eu/MediaValue"/>
    <adms:status
rdf:resource="http://inspire.ec.europa.eu/registry/status/valid"/>
  </rdf:Description>
</rdf:RDF>
```

## 6.4 Validating the descriptors

To check the validity of the registry/register descriptor formats described above, two XSLT validators are provided (see Annex B).

The XSLT validators included in Annex B can be used to easily check the conformance of the registry and register descriptors. They are available at the following links:

- **Registry descriptor validator:** [http://inspire-regadmin.jrc.ec.europa.eu/register-federation/validators/Registry\\_descriptor\\_validator.xsl](http://inspire-regadmin.jrc.ec.europa.eu/register-federation/validators/Registry_descriptor_validator.xsl)
- **Register descriptor validators:** [http://inspire-regadmin.jrc.ec.europa.eu/register-federation/validators/Register\\_descriptor\\_validator.xsl](http://inspire-regadmin.jrc.ec.europa.eu/register-federation/validators/Register_descriptor_validator.xsl)

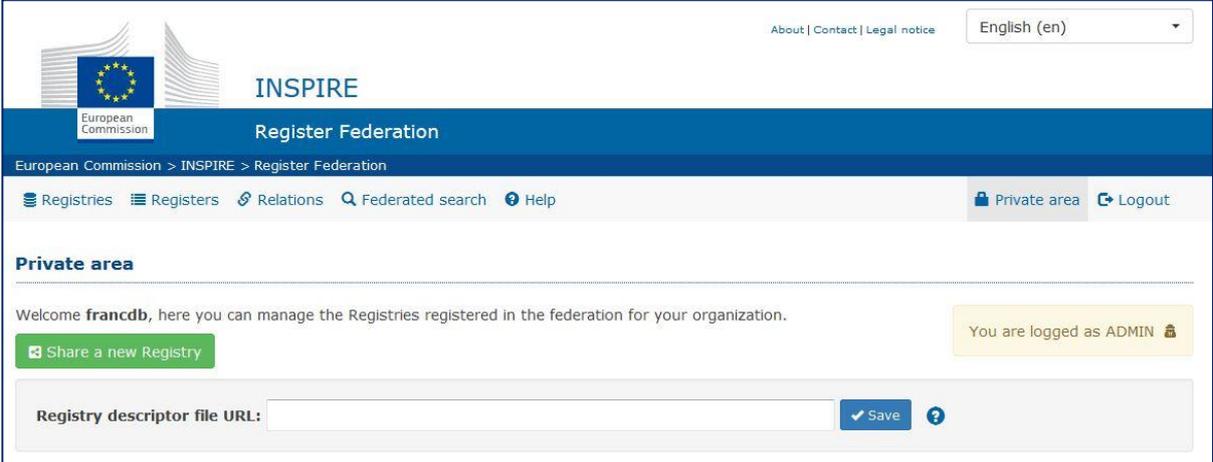

**NOTE** the XSLT validators should be used to support the user during the creation of the Descriptors. The XSLT validators perform checks related to the correctness of the format. Additional checks will be done by the RoR (e.g. whether URLs included in the descriptors can actually be reached). It is therefore possible that some descriptors pass the XSLT validator but do not pass the RoR checks.

## 6.5 Registering descriptors in the RoR

To be able to access the administrative area of the INSPIRE Register Federation, a user account is needed. The steps to follow in order to obtain an account are described in the INSPIRE Register Federation help page at <http://inspire-regadmin.jrc.ec.europa.eu/ror/help.jsp>.

The registration of the registry descriptor(s) in the RoR is a manual process, assisted by the RoR GUI.

Once logged in, there is the green button in the INSPIRE Register Federation administration area for sharing a new registry descriptor. The resolvable URL of the registry descriptor needs to be provided in the related field.

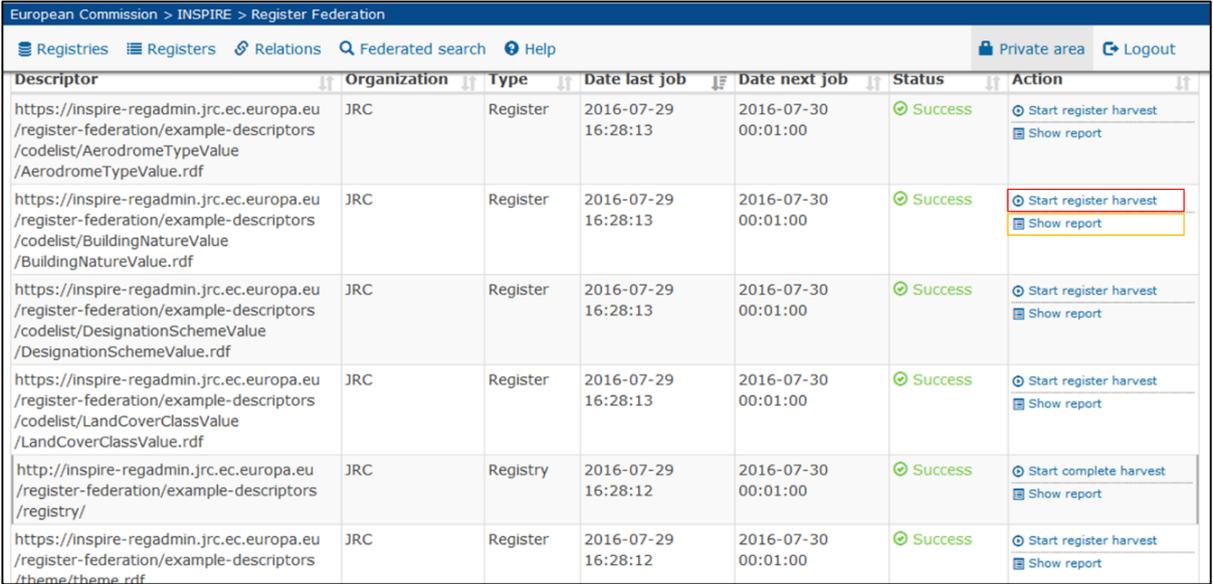

The screenshot shows the INSPIRE Register Federation administration interface. At the top, there is a navigation bar with the European Commission logo and the text 'INSPIRE Register Federation'. Below this, a breadcrumb trail reads 'European Commission > INSPIRE > Register Federation'. A secondary navigation bar contains links for 'Registries', 'Registers', 'Relations', 'Federated search', and 'Help', along with 'Private area' and 'Logout' buttons. The main content area is titled 'Private area' and includes a welcome message: 'Welcome francdb, here you can manage the Registries registered in the federation for your organization.' A green button labeled 'Share a new Registry' is visible. Below this is a form with a text input field for 'Registry descriptor file URL:' and a blue 'Save' button with a help icon.

Figure 7 - INSPIRE Register Federation administration page: adding a new registry descriptor

Once the descriptor has been added, the RoR starts to check it and the register descriptors referenced. If all the checks are completed successfully, the system starts to harvest the information.

After the first harvesting, the user can always start a harvesting process manually and check the execution report using the web interface (Figure 8). If the “update frequency” field is available in the descriptor files, the system will automatically start the harvesting process at the defined interval.

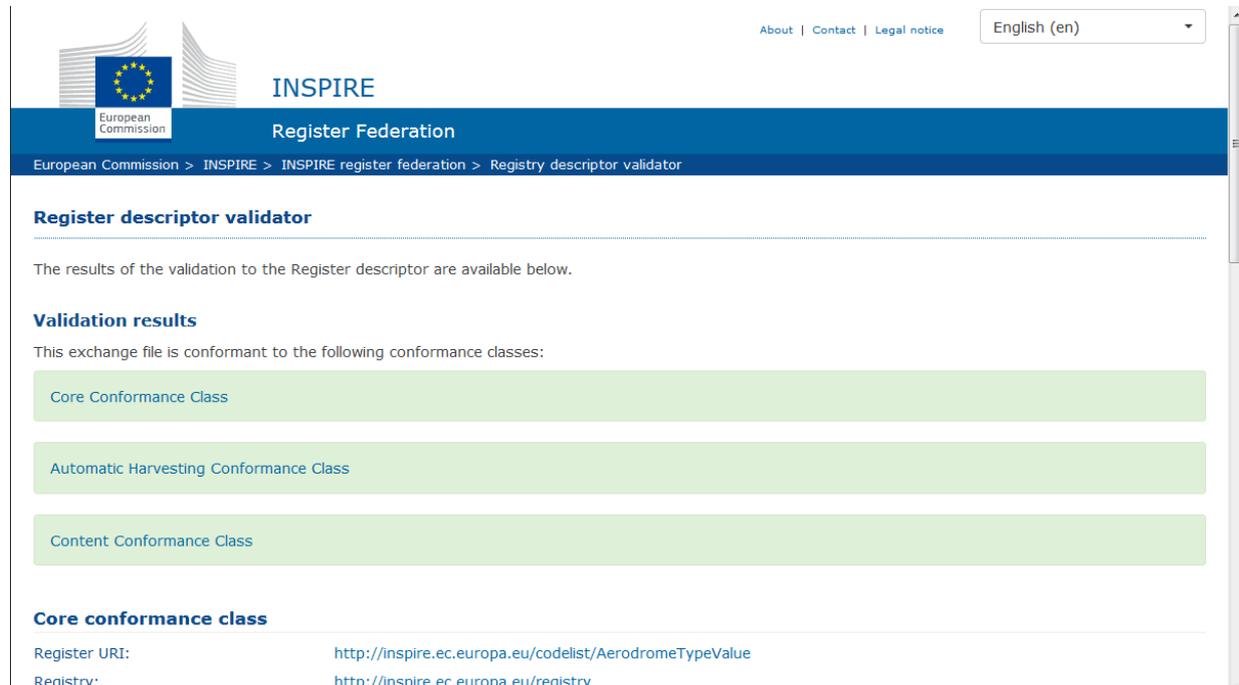

The screenshot shows a table of registered registry descriptors. The table has the following columns: Descriptor, Organization, Type, Date last job, Date next job, Status, and Action. The second row is highlighted in yellow, and the 'Start register harvest' button in the Action column is highlighted in red.

Descriptor	Organization	Type	Date last job	Date next job	Status	Action
<a href="https://inspire-regadmin.jrc.ec.europa.eu/register-federation/example-descriptors/codelist/AerodromeTypeValue/AerodromeTypeValue.rdf">https://inspire-regadmin.jrc.ec.europa.eu/register-federation/example-descriptors/codelist/AerodromeTypeValue/AerodromeTypeValue.rdf</a>	JRC	Register	2016-07-29 16:28:13	2016-07-30 00:01:00	Success	Start register harvest Show report
<a href="https://inspire-regadmin.jrc.ec.europa.eu/register-federation/example-descriptors/codelist/BuildingNatureValue/BuildingNatureValue.rdf">https://inspire-regadmin.jrc.ec.europa.eu/register-federation/example-descriptors/codelist/BuildingNatureValue/BuildingNatureValue.rdf</a>	JRC	Register	2016-07-29 16:28:13	2016-07-30 00:01:00	Success	Start register harvest Show report
<a href="https://inspire-regadmin.jrc.ec.europa.eu/register-federation/example-descriptors/codelist/DesignationSchemeValue/DesignationSchemeValue.rdf">https://inspire-regadmin.jrc.ec.europa.eu/register-federation/example-descriptors/codelist/DesignationSchemeValue/DesignationSchemeValue.rdf</a>	JRC	Register	2016-07-29 16:28:13	2016-07-30 00:01:00	Success	Start register harvest Show report
<a href="https://inspire-regadmin.jrc.ec.europa.eu/register-federation/example-descriptors/codelist/LandCoverClassValue/LandCoverClassValue.rdf">https://inspire-regadmin.jrc.ec.europa.eu/register-federation/example-descriptors/codelist/LandCoverClassValue/LandCoverClassValue.rdf</a>	JRC	Register	2016-07-29 16:28:13	2016-07-30 00:01:00	Success	Start register harvest Show report
<a href="http://inspire-regadmin.jrc.ec.europa.eu/register-federation/example-descriptors/registry/">http://inspire-regadmin.jrc.ec.europa.eu/register-federation/example-descriptors/registry/</a>	JRC	Registry	2016-07-29 16:28:12	2016-07-30 00:01:00	Success	Start complete harvest Show report
<a href="https://inspire-regadmin.jrc.ec.europa.eu/register-federation/example-descriptors/theme/theme.rdf">https://inspire-regadmin.jrc.ec.europa.eu/register-federation/example-descriptors/theme/theme.rdf</a>	JRC	Register	2016-07-29 16:28:12	2016-07-30 00:01:00	Success	Start register harvest Show report

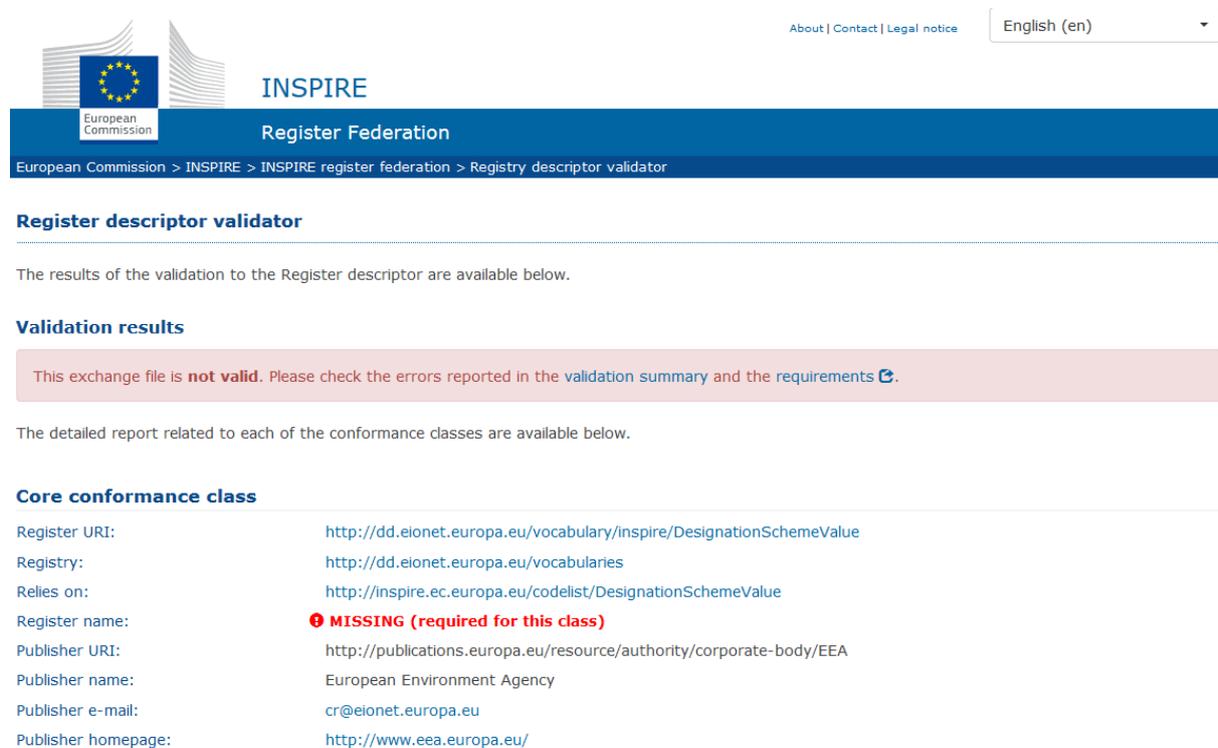

Figure 8 - Manual Harvesting start (red) & Report check (yellow highlight)

The “Show report” functionality allows the inspection of the result of the latest harvesting procedure. A dialogue window will display the descriptor file validation result (Figure 9). In case an error occurs before the validation process, the dialog will provide the description of the specific error.

The screenshot shows the 'Register descriptor validator' page. At the top, there is a navigation bar with the European Commission logo, the INSPIRE logo, and the text 'Register Federation'. Below this is a breadcrumb trail: 'European Commission > INSPIRE > INSPIRE register federation > Registry descriptor validator'. The main heading is 'Register descriptor validator'. The text below reads: 'The results of the validation to the Register descriptor are available below.' Under 'Validation results', it states: 'This exchange file is conformant to the following conformance classes:'. Three green boxes list the classes: 'Core Conformance Class', 'Automatic Harvesting Conformance Class', and 'Content Conformance Class'. Below this, under 'Core conformance class', there is a table with two rows: 'Register URI' pointing to 'http://inspire.ec.europa.eu/codelist/AerodromeTypeValue' and 'Registry' pointing to 'http://inspire.ec.europa.eu/registry'.

Figure 9 - Harvesting report dialogue – Validation success

The screenshot shows the 'Register descriptor validator' page with a validation failure. The breadcrumb trail is the same as in Figure 9. Under 'Validation results', a red box contains the message: 'This exchange file is **not valid**. Please check the errors reported in the [validation summary](#) and the [requirements](#).' Below this, it says: 'The detailed report related to each of the conformance classes are available below.' Under 'Core conformance class', there is a table with the following data:

Register URI:	<a href="http://dd.eionet.europa.eu/vocabulary/inspire/DesignationSchemeValue">http://dd.eionet.europa.eu/vocabulary/inspire/DesignationSchemeValue</a>
Registry:	<a href="http://dd.eionet.europa.eu/vocabularies">http://dd.eionet.europa.eu/vocabularies</a>
Relies on:	<a href="http://inspire.ec.europa.eu/codelist/DesignationSchemeValue">http://inspire.ec.europa.eu/codelist/DesignationSchemeValue</a>
Register name:	<b>MISSING (required for this class)</b>
Publisher URI:	<a href="http://publications.europa.eu/resource/authority/corporate-body/EEA">http://publications.europa.eu/resource/authority/corporate-body/EEA</a>
Publisher name:	European Environment Agency
Publisher e-mail:	<a href="mailto:cr@eionet.europa.eu">cr@eionet.europa.eu</a>
Publisher homepage:	<a href="http://www.eea.europa.eu/">http://www.eea.europa.eu/</a>

Figure 10 - Harvesting report dialogue – Validation failure

## 7 How to use the INSPIRE Register Federation

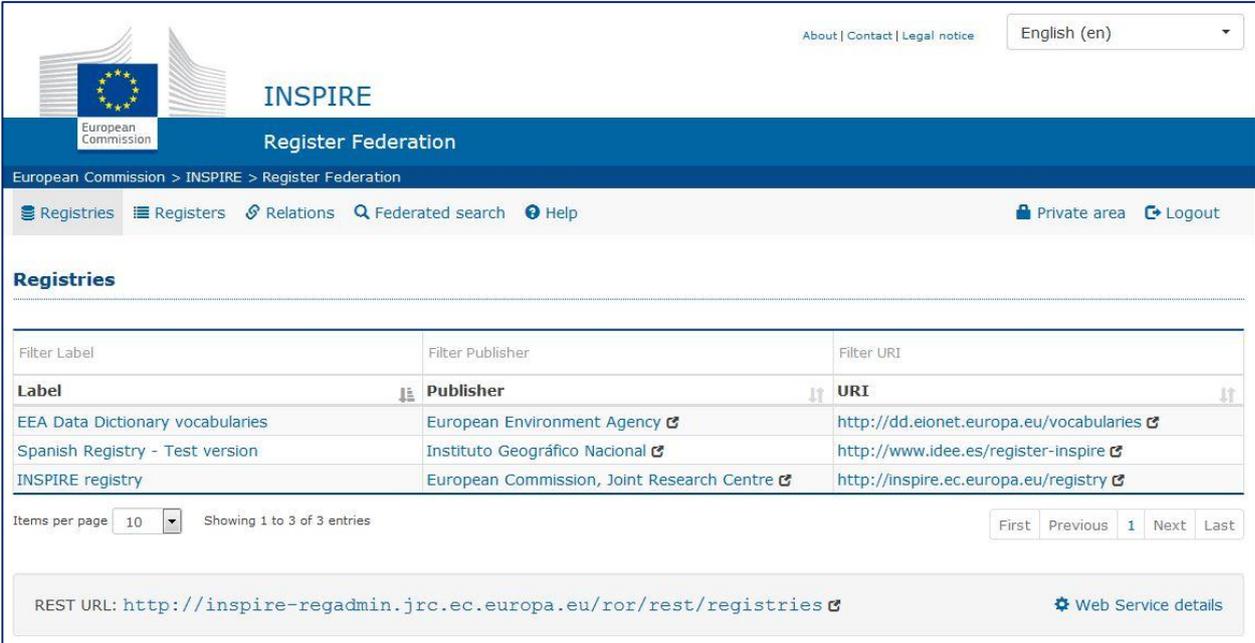

The RoR, the INSPIRE register federation's public web interface, allows the user to browse through and/or search for registries and registers available in the federation as well as the relations between them.

### 7.1 Browsing the federation content

The browsable registers are "Registries", "Registers" and "Relations". Each of them has a page containing the list of items and a page with the details of the item.

#### 7.1.1 Registries

The "Registries" register contains the list of the federated registries (Figure 11). The detail page (Figure 12) contains data related to the registry and the list of related registers (if available).

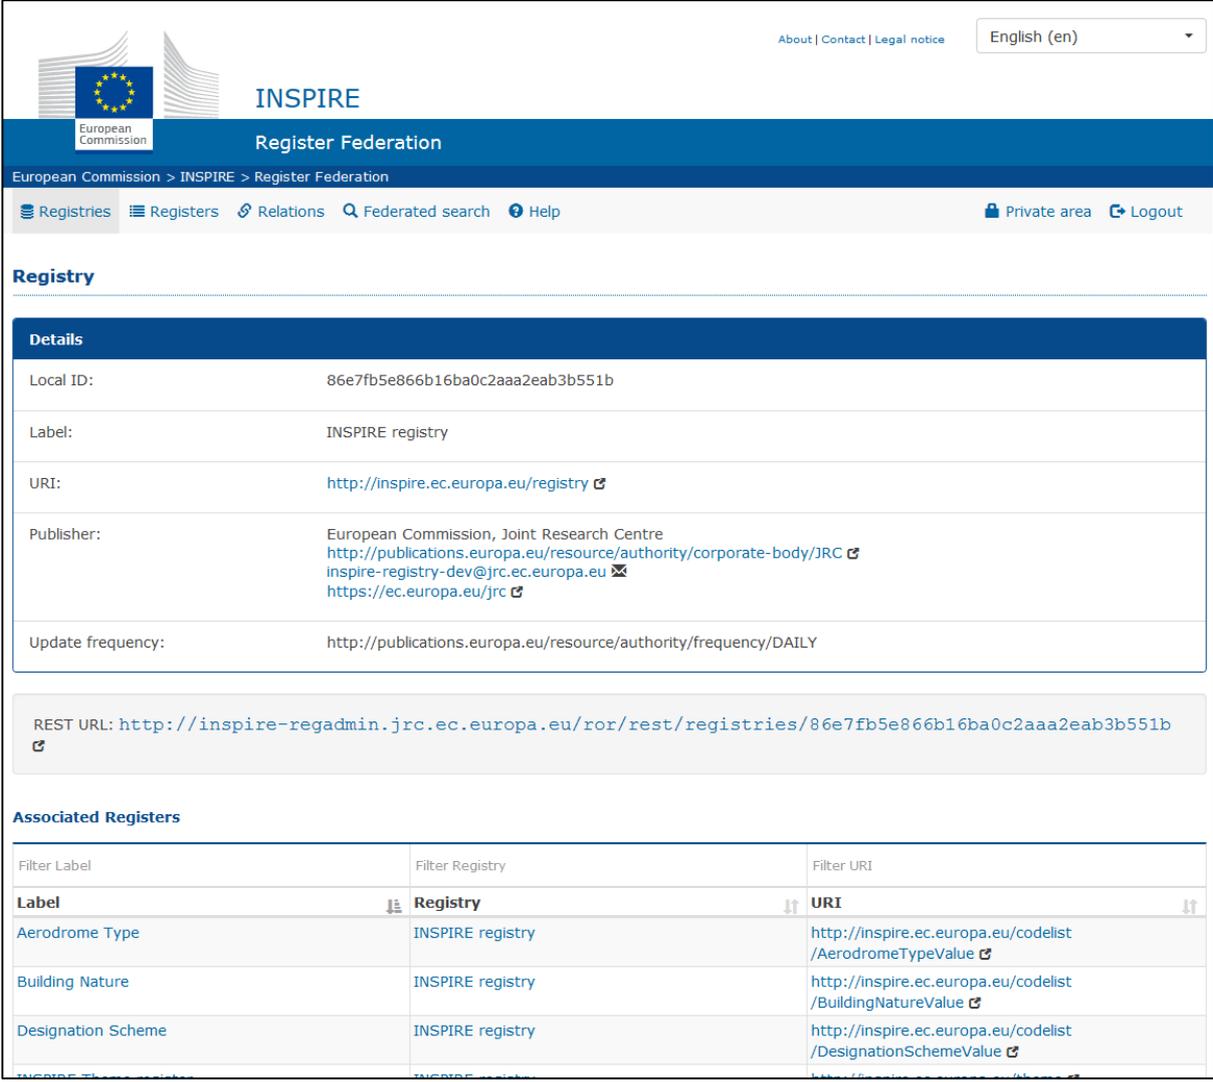

The screenshot shows the INSPIRE Register Federation interface. At the top, there is a header with the European Commission logo and the text 'INSPIRE Register Federation'. Below the header, there is a navigation menu with options: Registries, Registers, Relations, Federated search, and Help. A language dropdown menu is set to 'English (en)'. The main content area is titled 'Registries' and contains a table with the following data:

Filter Label	Filter Publisher	Filter URI
Label	Publisher	URI
EEA Data Dictionary vocabularies	European Environment Agency <a href="#">↗</a>	<a href="http://dd.eionet.europa.eu/vocabularies">http://dd.eionet.europa.eu/vocabularies</a> <a href="#">↗</a>
Spanish Registry - Test version	Instituto Geográfico Nacional <a href="#">↗</a>	<a href="http://www.idee.es/register-inspire">http://www.idee.es/register-inspire</a> <a href="#">↗</a>
INSPIRE registry	European Commission, Joint Research Centre <a href="#">↗</a>	<a href="http://inspire.ec.europa.eu/registry">http://inspire.ec.europa.eu/registry</a> <a href="#">↗</a>

Below the table, there are controls for 'Items per page' (set to 10) and 'Showing 1 to 3 of 3 entries'. Navigation buttons for 'First', 'Previous', '1', 'Next', and 'Last' are present. At the bottom, the REST URL is displayed as <http://inspire-regadmin.jrc.ec.europa.eu/ror/rest/registries> with a 'Web Service details' link.

Figure 11 - Example of the INSPIRE Register Federation browsing interface: Registries

The screenshot shows the INSPIRE Register Federation interface. At the top, there is a navigation bar with the INSPIRE logo and the European Commission logo. The page title is "Register Federation". Below the navigation bar, there is a breadcrumb trail: "European Commission > INSPIRE > Register Federation". The main navigation menu includes "Registries", "Registers", "Relations", "Federated search", and "Help". There are also links for "Private area" and "Logout".

The "Registry" section is highlighted, showing the following details:

- Local ID:** 86e7fb5e866b16ba0c2aaa2eab3b551b
- Label:** INSPIRE registry
- URI:** <http://inspire.ec.europa.eu/registry>
- Publisher:** European Commission, Joint Research Centre  
<http://publications.europa.eu/resource/authority/corporate-body/JRC>  
[inspire-registry-dev@jrc.ec.europa.eu](mailto:inspire-registry-dev@jrc.ec.europa.eu)  
<https://ec.europa.eu/jrc>
- Update frequency:** <http://publications.europa.eu/resource/authority/frequency/DAILY>

Below the details, there is a REST URL: <http://inspire-regadmin.jrc.ec.europa.eu/ror/rest/registries/86e7fb5e866b16ba0c2aaa2eab3b551b>

The "Associated Registers" section contains a table with the following data:

Filter Label	Filter Registry	Filter URI
<b>Label</b>	<b>Registry</b>	<b>URI</b>
Aerodrome Type	INSPIRE registry	<a href="http://inspire.ec.europa.eu/codelist/AerodromeTypeValue">http://inspire.ec.europa.eu/codelist/AerodromeTypeValue</a>
Building Nature	INSPIRE registry	<a href="http://inspire.ec.europa.eu/codelist/BuildingNatureValue">http://inspire.ec.europa.eu/codelist/BuildingNatureValue</a>
Designation Scheme	INSPIRE registry	<a href="http://inspire.ec.europa.eu/codelist/DesignationSchemeValue">http://inspire.ec.europa.eu/codelist/DesignationSchemeValue</a>

Figure 12 - Example of Registry details page

## 7.1.2 Registers

The "Registers" section contains the list of the federated registers. The detail page contains data related to the register and (if available) the list of related relations and items (Figure 13).

## Register

Figure 14 - Example of Relation register

## 7.2 Searching for content in the federation

The INSPIRE Register Federation allows full text search in the overall catalogue of items registered in the federation. Using this search functionality there is the possibility to find a specific register or item across all the federated registers.

The search interface allows simple and complex queries (e.g. incorporating the operators AND, OR and the exclusion of terms e.g. - "example terms").

European Commission > INSPIRE > Register Federation

Registries Registers Relations Federated search Help Private area Logout

**Federated search**

Search in the INSPIRE Register Federation ... Search

**This search engine will search through all of the items available in the INSPIRE Register Federation.**

In addition to the simple queries you can also use more complex syntax:

- Enclose exact words in quotes: "example terms"
- Use AND, OR operators
- Prepend the sign - (minus) the words to exclude: -example, - "example terms"

If you cannot find a page that you know exists, please let us know using the [feedback platform](#)

Legend: Registry | Register | Item

Figure 15 - Example of search interface

## 7.3 API interface

This is an item for future work.

## Annex A Example descriptors

This annex contains complete example descriptors for the three conformance classes. In the descriptors for the *Automatic Harvesting* and *Content* conformance classes, the additional sections with respect to the previous conformance class are **highlighted**.

### A.1 Core conformance class

#### A.1.1 Registry descriptor

The following example is also available here: [https://ies-svn.jrc.ec.europa.eu/register-federation/example-descriptors/Registry\\_core\\_conformance\\_class\\_example.rdf](https://ies-svn.jrc.ec.europa.eu/register-federation/example-descriptors/Registry_core_conformance_class_example.rdf)

```

## Annex B Descriptor Validators

The XSL validators included in this section can be used to easily check the conformance of the registry and register descriptors. They are available at the following links:

- **Registry descriptor validator:** [http://inspire-regadmin.jrc.ec.europa.eu/register-federation/validators/Registry\\_descriptor\\_validator.xsl](http://inspire-regadmin.jrc.ec.europa.eu/register-federation/validators/Registry_descriptor_validator.xsl)
- **Register descriptor validators:** [http://inspire-regadmin.jrc.ec.europa.eu/register-federation/validators/Register\\_descriptor\\_validator.xsl](http://inspire-regadmin.jrc.ec.europa.eu/register-federation/validators/Register_descriptor_validator.xsl)

NOTE the XSL validators should be used to support the user during the creation of the Descriptors. The XSL validators perform checks related to the correctness of the format. Additional checks will be done by the RoR (e.g. whether URLs included in the descriptors can actually be reached). It is therefore possible that some descriptors pass the XSL validator but do not pass the RoR checks.

To enable the validation, the XSL stylesheet has to be included in the RDF descriptor, just after the XML declaration. An example for a registry descriptor and for a register descriptor are provided below.

### EXAMPLE Registry descriptor

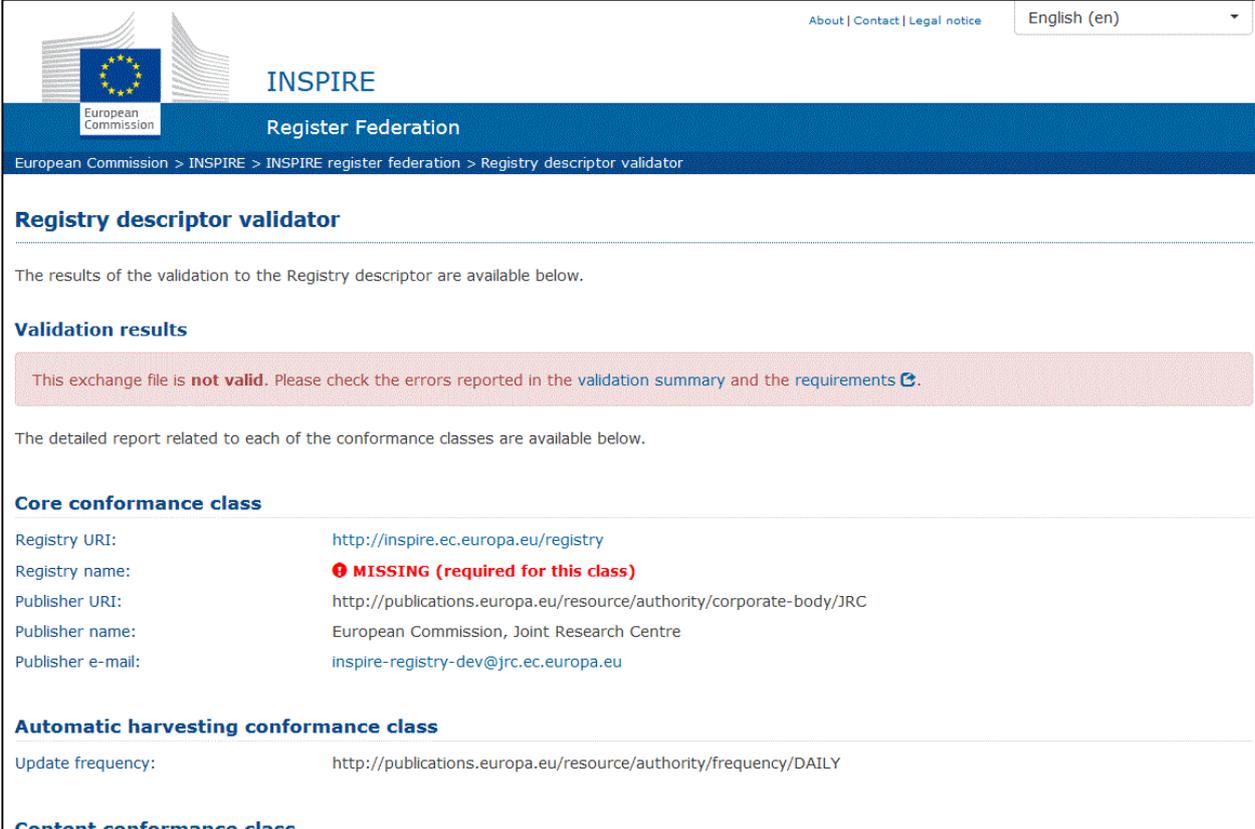

```
<?xml version="1.0" encoding="UTF-8"?>
<?xml-stylesheet type="text/xsl" href="http://inspire-
regadmin.jrc.ec.europa.eu/register-
federation/validators/Registry_descriptor_validator.xsl"?>
<rdf:RDF
  xmlns:dcat = "http://www.w3.org/ns/dcat#"
  xmlns:dct  = "http://purl.org/dc/terms/"
  xmlns:foaf = "http://xmlns.com/foaf/0.1/"
  xmlns:rdf  = "http://www.w3.org/1999/02/22-rdf-syntax-ns#"
>
<!-- ## Registry descriptor: Core Conformance Class ## -->
[...]
```

### EXAMPLE Register descriptor

```
<?xml version="1.0" encoding="UTF-8"?>
<?xml-stylesheet type="text/xsl" href="http://inspire-
regadmin.jrc.ec.europa.eu/register-
federation/validators/Register_descriptor_validator.xsl"?>
<rdf:RDF
  xmlns:adms = "http://www.w3.org/ns/adms#"
  xmlns:dcat = "http://www.w3.org/ns/dcat#"
  xmlns:dct  = "http://purl.org/dc/terms/"
  xmlns:foaf = "http://xmlns.com/foaf/0.1/"
  xmlns:rdf  = "http://www.w3.org/1999/02/22-rdf-syntax-ns#"
  xmlns:skos = "http://www.w3.org/2004/02/skos/core#"
  xmlns:voaf = "http://purl.org/vocommons/voaf#"
>
<!-- ## Register descriptor: Core Conformance Class ## -->
[...]
```

Once the stylesheet has been included, the descriptor can be just opened in a browser that can automatically apply the XSL stylesheet (such as Firefox). In this way you can directly get the results as an HTML page (an example output is provided below).

NOTE Google Chrome and Opera browsers do not allow the XSL-stylesheet to be loaded due to a security restriction (on loading files from different domains). Firefox and Internet Explorer work though.

INSPIRE  
Register Federation

European Commission > INSPIRE > INSPIRE register federation > Registry descriptor validator

### Registry descriptor validator

The results of the validation to the Registry descriptor are available below.

#### Validation results

This exchange file is **not valid**. Please check the errors reported in the [validation summary](#) and the [requirements](#).

The detailed report related to each of the conformance classes are available below.

#### Core conformance class

Registry URI:	<a href="http://inspire.ec.europa.eu/registry">http://inspire.ec.europa.eu/registry</a>
Registry name:	<b>MISSING (required for this class)</b>
Publisher URI:	<a href="http://publications.europa.eu/resource/authority/corporate-body/JRC">http://publications.europa.eu/resource/authority/corporate-body/JRC</a>
Publisher name:	European Commission, Joint Research Centre
Publisher e-mail:	<a href="mailto:inspire-registry-dev@jrc.ec.europa.eu">inspire-registry-dev@jrc.ec.europa.eu</a>

## Annex C Using extended code lists when sharing INSPIRE data

This annex describes how data providers can use a code list extension or profile (published in a national or community register) to share their INSPIRE data in conformity with the IRs on interoperability of spatial data sets and services.

The annex is based on the extension pattern “code list extension”<sup>13</sup> in the pattern catalogue of the data model extensions study commissioned by Geonovum, under the umbrella of the MIG-T<sup>14</sup>.

### C.1 Intent

In data modelling, code lists are used to ensure consistent data with a clearly defined meaning. A code list defines permitted values for a property and unique identifiers for these values, e.g. `windTurbine` may be an allowed value in a code list describing the nature of a building. Code lists are used extensively in the INSPIRE data models. They are stored in the central INSPIRE registry, in order to allow implementers, users and applications to look up the values contained in a given code lists and the definition and descriptions of these values.

A relatively easy way to extend an INSPIRE data model is to extend or profile the code lists used in the model, e.g. in order to add further values (which could be completely new values or refinements of existing values through more specific, or narrower, values) or to restrict the set of values to be used for a certain attribute of a class.

The INSPIRE code lists<sup>15</sup> have been designed with extensibility in mind; each code list explicitly announces whether you are allowed to extend it:

1. A code list is not extensible (`none`)
2. A code list is extensible using narrower values (`narrower`)
3. The list is extensible using additional values at any level (`open`)
4. Any values are allowed (`any`)

When the code list you need to modify permits extension of any type and there is a type or classification property on the class you need to extend, you can often use code list extension instead of inheritance to create new subtypes. This helps to keep the number of structurally similar classes down and helps with general interoperability.

If the schema permits multiple instances of a coded value element and you are working with a hierarchical code list, you should add a more generic value in addition to the specific value. For example, the `currentUse` of a building could be classified as both `publicServices` (generic value) and `library` (specific value). This will also help with interoperability, in particular when you use your own, narrower, values.

Note that code list extensions are limited in scope, so there are many scenarios where they are not sufficient, e.g.

- when there is no infrastructure to publish the extended code list,
- when the code list doesn't permit extension (`none`), or
- when the values you are adding do not describe the same property as the existing values.

---

<sup>13</sup> <http://inspire-extensions.wetransform.to/patterns/codelist-extension.html>

<sup>14</sup> <http://inspire-extensions.wetransform.to/>

<sup>15</sup> <http://inspire.ec.europa.eu/codelist>

## C.2 Structure

In UML, we indicate usage of an extended code list by substituting the existing code list. No new subtype of the class that has the property using the code list is necessary in this case. In the data model, the extended code list would simply be represented by a sub-type of the original code list whose "vocabulary" tagged value points to the URI of the extended code list.

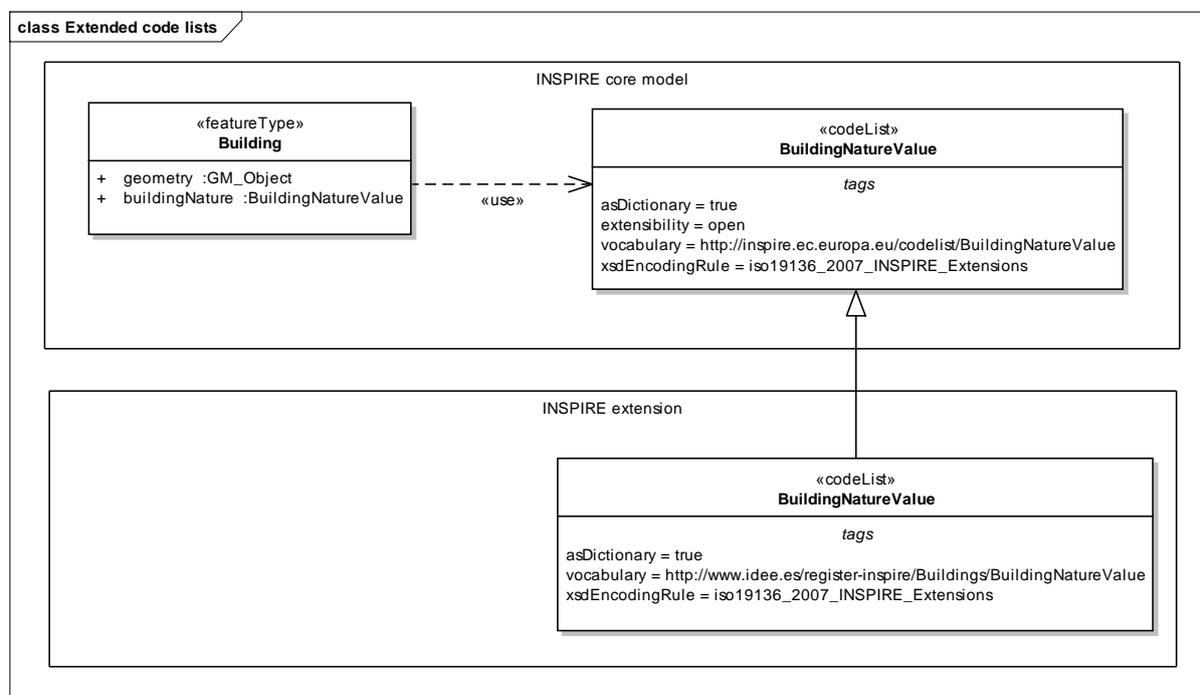

Figure 17 – *BuildingNatureValue* (in the INSPIRE extension package, available at <http://www.idee.es/register-inspire/Buildings/BuildingNatureValue>) extends *BuildingNatureValue* (in the INSPIRE core model, available at <http://inspire.ec.europa.eu/codelist/BuildingNatureValue>).

Alternatively, you might want to give a stronger indication that the extended/profiled code list needs to be used. In that case, you can define a constraint or create a subtype that *redefines* the property (buildingNature) in the example to use the extended code list instead. This is conceptually acceptable, since the extended code is a subtype of the original code list.

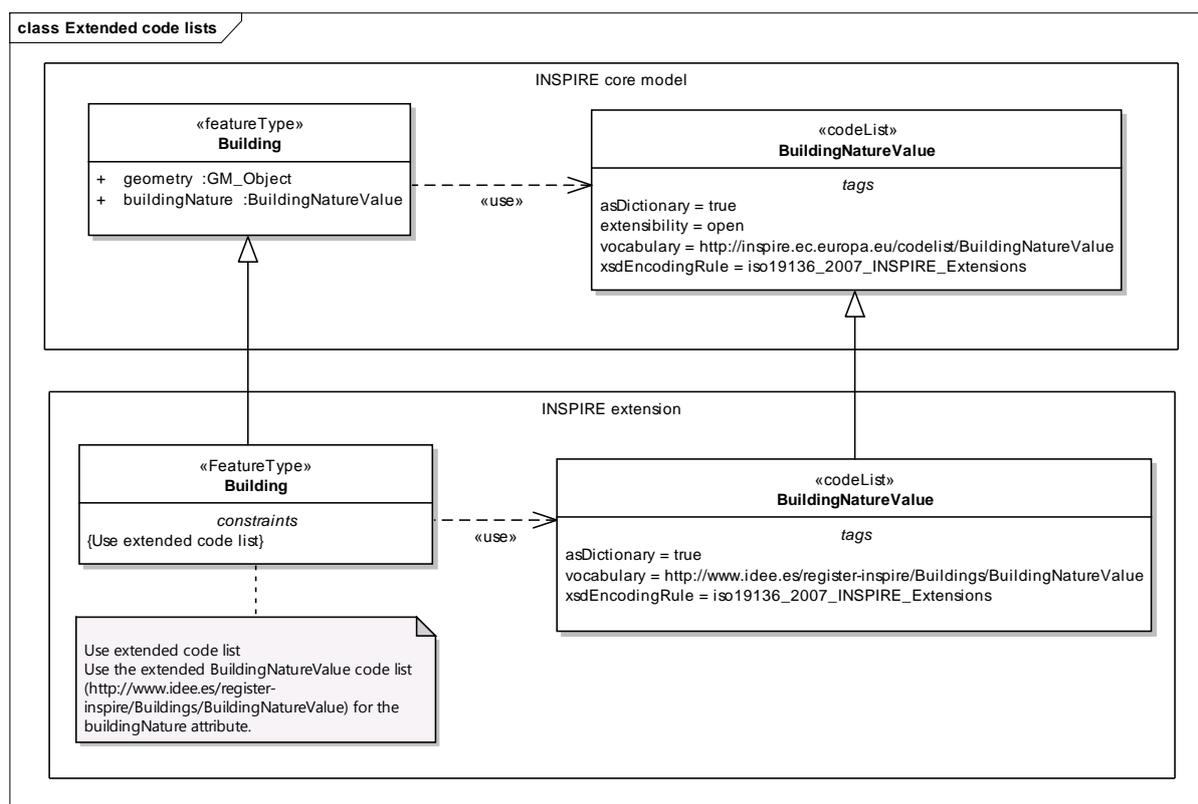

Figure 18 – An explicit reference to the extended *BuildingNatureValue* code list (in the INSPIRE extension package, available at <http://www.idее.es/register-inspire/Buildings/BuildingNatureValue>) through subtyping of *Building* and adding a constraint to use the extended code list for the attribute *buildingNature*.

### C.3 XML Schema Example

Since a GML 3.3 Application Schema encodes code list values using a `gml:ReferenceType`, there is no direct reference to either the extended code list or the new subtype. The GML Application schema does not need to be changed to allow usage of the extended code list.

However, the extended/profiled code list of course needs to be published through some kind of register (see best practices in section 4), and should be published in the INSPIRE register federation (see section 6). You can see the code list as an addendum to the schema that defines allowed values.

The example available at <http://www.idее.es/register-inspire/Buildings/BuildingNatureValue> reuses all values from the original code list <http://inspire.ec.europa.eu/codelist/BuildingNatureValue> and adds the following values:

- dovecote
- water mill
- bull ring
- mountain hut
- landmark
- warehouse

## C.4 XML Instance Example

In the GML instance, code list values are encoded using a `gml:ReferenceType`. In the `ReferenceType` element the `xlink:href` attribute points to the fully qualified name of the code list and the value. In addition, the INSPIRE guidelines recommend using the `xlink:title` attribute to a meaningful label.

```
(...)  
<bu-core2d:Building gml:id="ABC123">  
  <bu-base:beginLifespanVersion>2010-02-24T00:00:00+01:00</bu-base:beginLifespanVersion>  
  <bu-base:conditionOfConstruction  
xlink:href="http://inspire.ec.europa.eu/codelist/ConditionOfConstructionValue/functional"  
/>  
  <bu-base:endLifespanVersion nilReason="unknown" xsi:nil="true" />  
  <bu-base:inspireId>  
    <base:Identifier>  
      <base:localId>ABC123</base:localId>  
      <base:namespace>http://www.wettransform.to/ie-registry/buildings</base:namespace>  
    </base:Identifier>  
  </bu-base:inspireId>  
  <bu-base:buildingNature xlink:href="http://www.ideo.es/register-  
inspire/Buildings/BuildingNatureValue/watermill" xlink:title="water mill"/>  
  <bu-base:currentUse>  
    <bu-base:CurrentUse>  
      <bu-base:currentUse  
xlink:href="http://inspire.ec.europa.eu/codelist/CurrentUseValue/commerceAndServices"/>  
      <bu-base:percentage xsi:nil="true"/>  
    </bu-base:CurrentUse>  
  </bu-base:currentUse>  
  <bu-core2d:geometry2D>  
    <!-- Geometry -->  
  </bu-core2d:geometry2D>  
  </bu-core2d:Building>  
(...)
```

For the `bu-base:buildingNature` element, we use `xlink:href` to link to the complete, qualified and resolvable value definition of `watermill` (<http://www.ideo.es/register-inspire/Buildings/BuildingNatureValue/watermill>) from the extended code list. We also add a readable title by means of the `xlink:title` attribute.

## Annex D Registry information systems: available implementations

Even if this simple approach might seem the easiest one, using a structured web service (through a registry information system) has a lot of advantages.

It increases the value of reference codes by making them easy to re-use and reference through a resolvable URI over HTTP. It facilitates internationalization of user interfaces and of the codes by providing multilingual labels. It also ensures semantic interoperability when exchanging data between systems and applications.

A list of known registry information systems is provided below.

**Re3gistry software**<sup>16</sup>: The Re3gistry is an open source solution to help managing and sharing 'reference codes'. The software has been developed by the European Commission's Joint Research Centre within the ISA programme through the ARE3NA project.

**Linked Data Registry**<sup>17</sup>: The Linked Data Registry provides tools to manage a hierarchy of reference terms, delegating authority to different groups to maintain the data. The terms are automatically versioned so that information systems can point to known versions of a given controlled list while allowing new versions to be developed.

The **DataDictionary**<sup>18</sup> is another open source solution to help managing and sharing reference codes, code lists and other items. The solution is based on different open source software and has been developed by the European Environment Agency (EEA).
